TRAFFIC AND CIRCULATION ANALYSIS

D-1

**TRAFFIC ANALYSIS
DETAILED TABLES AND FIGURES**

Table D-1
Year 2024 (1 CVN) No Action Conditions –
Peak-Hour Intersection LOS Summary

Intersection		Traffic Control	2024 (1 CVN) No Action Alternative	
			AM	PM
1	Glorietta Blvd & Fourth St (SR-75)	One-Way Stop	44.1 (E)	18.7 (C)
2	Fourth St (SR-75) & Pomona Ave	One-Way Stop	24.7 (C)	320.2 (F)
3	Orange Ave (SR-75) & Third St (SR-75)	Signalized	28.0 (C)	40.3 (D)
4	Orange Ave (SR-75) & Fourth St (SR-75)	Signalized	37.3 (D)	59.6 (E)
5	Silver Strand Blvd/Orange Ave (SR-75) & Pomona Ave	Signalized	15.1 (B)	15.8 (B)
6	Silver Strand Blvd (SR-75) & Avenida De Las Arenas	Signalized	12.6 (B)	19.4 (B)
7	Silver Strand Blvd (SR-75) & Rendova Rd	Signalized	18.0 (B)	12.3 (B)
8	Silver Strand Blvd (SR-75) & Tarawa Rd	Signalized	50.2 (D)	70.7 (E)
9	Strand Way and Guadalcanal Road	Two-Way Stop	10.9 (B)	39.5 (E)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Signalized	3.0 (A)	70.7 (E)
11	Silver Strand Blvd (SR-75) & Fiddler's Cove Driveway	One-Way Stop	27.5 (D)	21.3 (C)
12	Silver Strand Blvd (SR-75) & Leyte Rd	Signalized	32.6 (C)	8.6 (A)
13	Silver Strand Blvd (SR-75) & Attu Ave	One-Way Stop	28.2 (D)	10.0 (A)
14	Silver Strand Blvd (SR-75) & Coronado Bay Rd	Signalized	6.9 (A)	3.4 (A)
15	SB Silver Strand Blvd (SR-75) & Coronado Cays Blvd	All-Way Stop	7.8 (A)	7.8 (A)
16	NB Silver Strand Blvd (SR-75) & Coronado Cays Blvd	Signalized	25.8 (C)	10.6 (B)
17	Silver Strand Blvd (SR-75) & Hooper Blvd	Signalized	Does not exist under this scenario	
18	Silver Strand Blvd (SR-75) & Rainbow Dr	Signalized	79.7 (E)	25.0 (C)
19	7th St & Silver Strand Blvd (SR-75)	Signalized	114.9 (F)	67.1 (E)
20	Silver Strand Blvd (SR-75) & Delaware St	Signalized	8.1 (A)	10.7 (B)
21	Driveway/Silver Strand Blvd & Palm Ave	Two-Way Stop	13.1 (B)	20.3 (C)
22	3rd St & Palm Ave	All-Way Stop	11.1 (B)	20.3 (C)

Intersection		Traffic Control	2024 (1 CVN) No Action Alternative	
			AM	PM
23	Palm Ave & Rainbow Dr	One-Way Stop	35.5 (E)	26.5 (D)
24	7th St & Palm Ave	Signalized	8.4 (A)	5.8 (A)
25	Delaware St & Palm Ave	One-Way Stop	12.0 (B)	12.7 (B)
26	9th St & Palm Ave (SR-75)	Signalized	40.1 (D)	48.4 (D)
27	Florida St & Palm Ave (SR-75)	Signalized	8.2 (A)	9.2 (A)
28	13th St & Palm Ave (SR-75)	Signalized	37.1 (D)	47.3 (D)
29	16th St & Palm Ave (SR-75)	Signalized	14.2 (B)	18.6 (B)
30	Saturn Blvd/19th St & Palm Ave (SR-75)	Signalized	50.9 (D)	175.5 (F)
31	I-5 SB Exit Ramp & Palm Ave (SR-75)	Signalized	32.2 (C)	45.6 (D)
32	I-5 NB Ramps & Palm Ave (SR-75)	Signalized	11.4 (B)	9.4 (A)
33	Silver Strand Blvd & YMCA Driveway	One-Way Stop	8.5 (A)	8.6 (A)

Note: Table reflects intersection delay (LOS). Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a one-way or two-way stop-controlled intersection, delay refers to the worst movement. LOS calculations are based on the methodology outlined in the 2000 Highway Capacity Manual and performed using Synchro 8.0. **Bold** values indicate intersections operating at LOS E or F.
SB=southbound; NB=northbound

Table D-2
Year 2024 (2 CVNs) No Action Conditions –
Peak-Hour Intersection LOS Summary

Intersection		Traffic Control	2024 (2 CVNs) No Action Alternative	
			AM	PM
1	Glorietta Blvd & Fourth St (SR-75)	One-Way Stop	62.2 (F)	20.0 (C)
2	Fourth St (SR-75) & Pomona Ave	One-Way Stop	27.7 (D)	550.7 (F)
3	Orange Ave (SR-75) & Third St (SR-75)	Signalized	47.6 (D)	43.9 (D)
4	Orange Ave (SR-75) & Fourth St (SR-75)	Signalized	38.3 (D)	106.1 (F)
5	Silver Strand Blvd/Orange Ave (SR-75) & Pomona Ave	Signalized	16.2 (B)	15.8 (B)
6	Silver Strand Blvd (SR-75) & Avenida De Las Arenas	Signalized	12.8 (B)	19.6 (B)
7	Silver Strand Blvd (SR-75) & Rendova Rd	Signalized	18.4 (B)	12.4 (B)
8	Silver Strand Blvd (SR-75) & Tarawa Rd	Signalized	50.7 (D)	72.4 (E)
9	Strand Way and Guadalcanal Road	Two-Way Stop	10.9 (B)	39.5 (E)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Signalized	3.0 (A)	77.3 (E)
11	Silver Strand Blvd (SR-75) & Fiddler's Cove Driveway	One-Way Stop	28.3 (D)	22.0 (C)
12	Silver Strand Blvd (SR-75) & Leyte Rd	Signalized	36.3 (D)	9.7 (A)
13	Silver Strand Blvd (SR-75) & Attu Ave	One-Way Stop	29.1 (D)	10.0 (B)
14	Silver Strand Blvd (SR-75) & Coronado Bay Rd	Signalized	7.1 (A)	3.4 (A)
15	SB Silver Strand Blvd (SR-75) & Coronado Cays Blvd	All-Way Stop	7.8 (A)	7.8 (A)
16	NB Silver Strand Blvd (SR-75) & Coronado Cays Blvd	Signalized	28.5 (C)	10.5 (B)
17	Silver Strand Blvd (SR-75) & Hooper Blvd	Signalized	Does not exist under this scenario	
18	Silver Strand Blvd (SR-75) & Rainbow Dr	Signalized	85.1 (F)	25.6 (C)
19	7th St & Silver Strand Blvd (SR-75)	Signalized	114.0 (F)	67.0 (E)
20	Silver Strand Blvd (SR-75) & Delaware St	Signalized	8.0 (A)	10.7 (B)
21	Driveway/Silver Strand Blvd & Palm Ave	Two-Way Stop	13.1 (B)	20.3 (C)

Note: Table reflects intersection delay (LOS). Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a one-way or two-way stop-controlled intersection, delay refers to the worst movement. LOS calculations are based on the methodology outlined in the 2000 Highway Capacity Manual and performed using Synchro 8.0. **Bold** values indicate intersections operating at LOS E or F. SB=southbound; NB=northbound

EXECUTIVE SUMMARY

Project Description

There are several Navy facilities that make up the Naval Base Coronado (NBC) in southwest California. NBC has a large presence within the City of Coronado, with three military facilities that include Naval Air Station North Island (NASNI) located on the northwestern end of Coronado Island, Naval Amphibious Base (NAB) located on the northern portion of the Silver Strand, and Silver Strand Training Complex (SSTC), or formerly known as the Naval Radio Receiving Facility (NRRF), located on the south portion of the Silver Strand.

The proposed project seeks to expand the naval campus at SSTC and redistribute personnel from the NASNI and NAB Coronado military facilities. This study evaluates the traffic conditions within the study area with one, two, and three homeported Carrier Vessel Nuclear (CVNs) in port at NASNI for three different build alternatives and compares them against a no-build alternative for Existing, Year 2024, and Year 2040 Conditions.

Analysis Scenarios

The following scenarios were analyzed as part of this study:

Existing Conditions

When data was being collected for the study intersections, either one or zero CVNs were in port. Traffic conditions at NBC change depending on the number of CVNs in port at NASNI. For the intersections that did not have a CVN in port at the time of data collection, the traffic counts collected were adjusted using trip generation formulas to forecast traffic volumes so that all of the existing data would reflect one CVN in port. The existing with one CVN in port data was further adjusted to develop baseline existing conditions with two and three CVNs in port.

Year 2024 Conditions

Year 2024 is the year at which all proposed project construction is assumed to be completed and the new facilities are fully operational. The Year 2024 roadway network is assumed to be the same as in the Existing Condition. The traffic was analyzed with the following number of CVNs in port:

- One CVN in port
- Two CVNs in port
- Three CVNs in port (with staggered work hours)

Year 2040 Conditions

Year 2040 is the future year that represents a horizon year conditions, approximately 30 years from existing conditions. The Year 2040 roadway network is assumed to be the same as in the Existing Condition and is consistent with adjacent City-adopted community plans. The traffic was analyzed with the following number of CVNs in port:

- One CVN in port
- Two CVNs in port
- Three CVNs in port (with staggered work hours)

For each of these study years a No-Action Alternative was analyzed. Under no-action conditions, it is assumed that the NBC Coastal Campus project would not take place and no construction or operational trips relating to the NBC Coastal Campus project would be in effect. Background growth and roadway network improvements independent of the Proposed Action would still occur.

For Year 2024 and Year 2040 study scenarios, three project alternatives (Alternative 1, 2, and 3) were analyzed. These project alternatives were compared to the No Action Alternative to determine the Proposed Action's impact on the study area.

Alternative 1 (SSTC-South Alternative) and Alternative 2 (SSTC-South Expanded Footprint Alternative) would have all of the proposed facilities within the expanded SSTC-South training site. The relocation of personnel from NASNI and NAB Coronado would be the same for these alternatives, but the layout of the facilities within SSTC-South would be different. Alternative 3 (Multi-Installation Alternative) would have the proposed facilities split between NASNI, NAB Coronado, and SSTC-South, resulting in a different personnel distribution than the other two alternatives.

In addition, an analysis was performed for each scenario without the implementation of the MILCON included in the Proposed Action that would install a new ECP along Silver Strand Boulevard (SR-75).

Forecast Traffic Volumes

To generate Year 2040 volumes from existing volumes, a comparison of San Diego Association of Governments (SANDAG) Series 12 Traffic Forecast Models was performed. The growth between 2008 and 2040 forecast model volumes along the roadway segments in the area was calculated. Average anticipated growth in different areas was calculated, and the respective growth factor was applied to the existing intersection volumes to estimate Year 2040 volumes.

To determine Year 2024 traffic volumes, linear interpolation was used between the existing one-CVN scenario and the Year 2040 one-CVN scenario. Specifically, the growth in volumes between the existing and Year 2040 scenarios was assumed to be equally distributed over each year. That annual growth rate was multiplied by 12 to reflect the 12 years between existing conditions and Year 2024, and was applied to existing-condition volumes to estimate Year 2024 baseline volumes.

Trip Generation

The trip generation step in transportation modeling relates the number of trips being produced from a zone or site by time period to the land use and demographic characteristics found at that location. The Proposed Action's trip generation was calculated based on the number of personnel relocating to use the new facilities upon completion. A trip rate of 2.5 daily trips per person was used, consistent with the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region prepared by SANDAG in 2002. Peak-hour trip rates were obtained from the same source. These rates published by SANDAG take into account some carpooling and transit activities.

Trip Distribution and Assignment

The trip distribution step in modeling connects the trips originating in the study zone or site to where these trips are destined. For the Proposed Action, trip distribution assumptions were made based on traffic count data, SANDAG's Series 12 model, and previous studies in the area. Separate trip distributions were created for NAB Coronado, SSTC-South, and NASNI. Trip generation results were applied to the network using the trip distributions prepared for each installation separately and then were combined to provide the total trip assignment for the respective alternative.

Summary of Intersection Analyses

Table E-1 summarizes the locations at which impacts were found and during which scenarios those impacts were found to occur.

Table E-1. Peak-Hour Intersection Analysis Impact Summary

Potential Improvements

This study identified twelve improvements that could be made to the study area intersections to address inadequate operations with implementation of the NBC Coastal Campus. Eight of the improvements would apply to Alternatives 1, 2, or 3 as long as MILCON P947 is implemented. One of those eight improvements only occurs in Year 2040 with 2 CVNs and is not recommended for implementation as a result of this project. The four other improvements would only apply if P947 is not implemented.

The following seven improvements are recommended as mitigation measures for the NBC Coastal Campus. These improvements were developed with input from Caltrans. Prior to implementation, the proposed improvements should be confirmed with Caltrans and the respective City to ensure they are still necessary and are consistent with other planned improvements not known at the time of this study.

M1. Intersection #10, Silver Strand Boulevard (SR-75) & Tulagi Road

The significant impact at this intersection during the PM peak-hour can be mitigated by modifying the traffic signal timing by extending the green time on Silver Strand Boulevard (SR-75) by ten seconds to reflect a different traffic pattern that would be in place with the addition of the Proposed Action. The traffic signal is uncoordinated and the cycle length would be adjusted to include this additional ten seconds. No changes to the existing right-of-way and pavement width would be required.

M2. Intersection #18, Silver Strand Boulevard (SR-75) & Rainbow Drive

The significant impact at this intersection during the AM peak-hour can be mitigated by modifying the lane configuration on the eastbound Rainbow Drive approach. Changing the existing through-right lane into a left-through-right lane and extending the existing turn pocket to the intersection of Bonito Avenue increases capacity and queue area for this approach. The extension of the turn pocket would result in a loss of two 2-hour limit parking spaces. No changes to the existing right-of-way and pavement width would be required.

M3. Intersection #26, 9th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by restriping the northbound and southbound approaches to have exclusive left-turn lanes and a shared through-right lane. The signal operations could then be changed from split phasing to protected left-turn phasing for these approaches. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By changing the phasing, it allows the northbound and southbound through movements and pedestrian crossings to occur simultaneously, ultimately reducing the amount of time needed for 9th Street and providing more green time for Palm Avenue (SR-75).

M4. Intersection #28, 13th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by removing the pedestrian crossing on the east leg of the intersection and shortening the corresponding northbound split time. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By providing just a single crosswalk, it allows more green time to be assigned to the heavy movements on Palm Avenue (SR-75).

M5. Intersection #30, Saturn Boulevard/19th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated with the addition of a second westbound left-turn lane. There is currently a single westbound left-turn lane adjacent to an eight-foot wide raised median. To fit in a second left-turn lane within the existing curb width, the median would need to be reduced to four-feet wide and the eastbound through lane widths would need to be narrowed slightly. The bike lane would operate similar to its current layout.

M6. Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)

The significant impact at this intersection could be mitigated by striping the southbound approach to include a left-turn pocket and through-right lane. This would require removing some parking along 7th Street to make room for the additional lane, estimated to be two parking spaces.

M11. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact for Year 2040 at this intersection can be partially mitigated by extending the southbound right-turn storage pockets on the exit ramp. This would require widening of the ramp.

The following improvement is not recommended as mitigation measures for the NBC Coastal Campus. The City of Coronado has requested that this intersection is evaluated under separate environmental review at a later date to determine when, if, and what type of traffic control safety measures are necessary at this location.

M12. Intersection #11, Fidler's Cove Driveway and Silver Strand Boulevard (SR-75)

The impact at the intersection of Silver Strand Boulevard (SR-75) and Fiddler's Cove Driveway was only identified for Alternatives 1 and 2 when two CVNs are in port and is a result of cumulative traffic along Silver Strand Boulevard (SR-75) preventing gaps in traffic from occurring for vehicles attempting to turn left out of Fiddler's Cove driveway. It can be mitigated by restricting outbound left turns from the driveway.

For several reasons identified in this study, it is recommended that P947 is implemented as early as possible in the Proposed Action development. P947 is necessary to prevent traffic in Imperial Beach from becoming excessive and providing appropriate capacity and security facilities to process the increasing number of vehicles accessing SSTC-South. It is assumed that P947 is included in the Proposed Action and no additional mitigation measures are required; however, if P947 is not implemented, additional mitigation measures identified in this study would apply:

M7. Intersection #21, Silver Strand Boulevard and Palm Avenue

The significant impact at this intersection would require widening of Silver Strand Boulevard from two lanes to four lanes and installation of a traffic signal at the intersection. Even with these improvements the intersection would still operate at LOS E during the PM peak hour.

M8. Intersection #22, 3rd Street and Palm Avenue

The significant impact at this intersection during the AM and PM peak-hours can be mitigated with the installation of a traffic signal.

M9. Intersection #23, Palm Avenue and Rainbow Drive

The significant impact at this intersection during the AM and PM peak-hours can be mitigated by restricting southbound left-turn movements. Vehicles that want to head eastbound on Palm Avenue from Rainbow Drive could utilize the intersection of Rainbow Drive and Silver Strand Boulevard (SR-75), approximately 700 feet north of this intersection to head eastbound.

M10. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact for Year 2024 at this intersection during the PM peak-hour can be mitigated by adjusting the signal timing at the intersection. The length of the eastbound, westbound, and southbound signal splits would need to be increased by 5 seconds (for a total cycle increase of 10 seconds).

The following impact location was identified to not have reasonable or feasible mitigations for the NBC Coastal Campus:

The intersection of Orange Avenue (SR-75) and Fourth Street (SR-75) is considered an impact because it worsens an existing LOS F condition by more than 1 second. The increase in delay for the Alternative 3 scenario when two CVNs are in port is 1.1 seconds. There was no reasonable mitigation found for this location. This impact was identified for Alternative 3 scenarios with 2 CVNs in. It would be considered a significant and unavoidable impact for Alternative 3.

Implementation of Potential Improvements

Several improvements involve signal retiming or modifications along SR-75. It is suggested that the DON discuss the funding of improvements with Caltrans and other stakeholders to develop a joint funding approach.

It is also suggested that the DON pursue funding opportunities for early implementation of MILCON project P947 to prevent traffic congestion in Imperial Beach and establish an ECP with adequate capacity and appropriate security requirements.

Construction Traffic

Two different construction scenarios were evaluated:

“North only” assumes that all construction traffic would access SSTC-South through the location of the new north gate, Intersection 17 –Silver Strand Boulevard (SR-75) and Hooper Boulevard, and would use Palm Avenue (SR-75) to traverse between I-5 and the SSTC-South access point. Similarly, all operational traffic would access SSTC-South through the location of the new north gate. The trip distribution methodology for operational traffic is consistent with the methodology used for full build-out of the project. This scenario assumes that a proper ECP and proposed intersection improvements outside the ECP are completed. “North only” construction scenario summary tables are provided as follows:

“Construction North, Operations South” assumes that all construction traffic would access SSTC-South through the location of the new north gate, Intersection 17 –Silver Strand Boulevard (SR-75) and Hooper Boulevard, and would use Palm Avenue (SR-75) to traverse between I-5 and the SSTC-South access point. It assumes that all operational traffic would access SSTC-South through the existing south gate in Imperial Beach. This scenario assumes the new ECP may not be in place during the construction years. Proper security checkpoint procedures would still occur at the existing access for non-construction activity. “Construction North, Operations South” construction scenario summary tables are provided as follows:

Construction traffic will have impacts to the roadway network immediately at six locations along SR-75. Impacts continue to add on as the development intensity increases and buildings are opened for use. Year 2017 is when the intersections through Imperial Beach have impacts and represents an oversaturation of the existing roadway network in Imperial Beach for the “Construction North, Operations South” scenario. Regardless of the selected Alternative, some impact avoidance and minimization measures to consider for construction include:

- Construct the new ECP on Silver Strand Boulevard (SR-75) early in the construction schedule or provide temporary access at the ultimate new ECP location to minimize construction traffic in the residential neighborhoods of Imperial Beach;
- Install a traffic signal and make turn lane improvements at the intersection of Hooper Boulevard and Silver Strand Boulevard (SR-75) to support construction activity;
- Include construction management in the design aspect of the NBC Coastal Campus
- Coordinate construction activity with NBC representatives to monitor daily activity levels at each installation and minimize interruptions to operations;
- Schedule heavy vehicle activity during non-peak hours;
- Encourage carpooling and staggered work hours for construction workers; and
- Notify public stakeholders of times where abnormal construction activity would occur (i.e. bunker removal).

Additional Impact Minimization Measures

In addition to the physical improvements noted in this study that mitigate potential traffic impacts, the Navy should also consider implementing the following impact minimization measures:

- Establish and implement measures to reduce construction traffic to the extent practicable.
- Work with Caltrans to establish appropriate traffic control management at the interim gate at the Hooper Boulevard entrance until the proposed Entry Control Point is fully constructed.
- Monitor traffic at the existing entrance to SSTC-South located in Imperial Beach and incorporate measures as necessary to maintain traffic volumes less than or equal to the existing volume.
- Commit to providing MTS bus stops at the new Entry Control Point intersection.
- Form an internal Traffic Advisory Committee to address traffic concerns.
- Prepare a Transportation Demand Management (TDM) Plan for Naval Base Coronado. This TDM Plan would consider the following topics:
 - Military Transportation Incentive Program (TIP)
 - SANDAG's iCommute program
 - Transit Network
 - Bicycle Network
 - Bikesharing programs
 - Pedestrian
 - Carpool/Vanpool
 - Intra-Base shuttle system
 - Carsharing programs
 - Parking supply limitations
 - Parking fees
 - Ferry service
 - Entry Control Point staffing
 - Signal timings
 - Work hours
- Continue to implement the goals of the 2014 Memorandum of Agreement between the Navy and SANDAG to reduce drive-alone work trips.
- Continue to coordinate with SANDAG to understand and apply region-wide transportation demand management tools, such as the following SANDAG documents noted provided during the EIS comment period¹:

¹ Comment number 9.52, Chapter 10, Final Naval Base Coronado Coastal Campus Environmental Impact Study.

- Designing for Smart Growth, Creating Great Places in the San Diego Region
- Planning and Designing for Pedestrians, Model Guidelines for the San Diego Region
- Trip Generation for Smart Growth
- Parking Strategies for Smart Growth
- Regional Multimodal Transportation Analysis: Alternative Approaches for Preparing Multimodal Transportation Analysis in EIRs
- Integrating Transportation Demand Management into the Planning and Development Process – A Reference for Cities
- Riding to 2050, the San Diego Regional Bike Plan
- Healthy Communities Atlas

Implementation of these measures would be beyond what is required of the Navy to mitigate their impacts but would further improve traffic conditions through Imperial Beach and Coronado and is encouraged.

KEY TRAFFIC TERMS

AM or PM Peak Hours are those hours of the day in which the bulk of commute trips occur and in which traffic impacts are likely to be the greatest. The a.m. peak hour on Coronado generally occurred between 6:15 a.m. and 7:15 a.m. The p.m. peak hour on Coronado generally occurred between 2:30 p.m. and 3:30 p.m.

Capacity of a transportation facility is the maximum number of persons or vehicles that can be expected to traverse a point or uniform section of road within a specified time frame under prevailing roadway, traffic and control conditions. Theoretically, this is the point in which the flow rate (vehicles/hour) on the facility is the highest.

Highway Capacity Manual (HCM) is a publication of the Transportation Research Board. It contains concepts, guidelines, and computational procedures for computing the capacity and quality of service of various highway facilities, including freeways, signalized and unsignalized intersections, rural highways, and the effects of transit, pedestrians, and bicycles on the performance of these systems.

Level of Service (LOS) corresponds to “excellent” through “failure” conditions in terms of traffic congestion, both for road segments and for intersections. It is used to provide an indication of the amount of delay a driver would experience along a road segment or the amount of wait time a driver would experience at an intersection. LOS is rated on a scale of “A” through “F”, with “A” representing excellent, free flow conditions, and “F” representing failures of road segments or intersections.

Peak Hour Factor (PHF) describes the relationship between hourly traffic volumes and the maximum rate of flow within the hour. Peak Hour Factor is defined as the hourly volume divided by four times the maximum 15-minute volume within the hour.

Transportation Analysis Zone (TAZ) is the unit of geography most commonly used in conventional transportation planning models. The size of a zone varies, but for typical metropolitan planning software, a zone of under 3000 people is common.

1.0 INTRODUCTION

Project Description

The Navy is proposing to develop an academic campus to support the current and future operational readiness of personnel with the Naval Special Warfare Command (NSWC) on Naval Base Coronado (NBC) in San Diego County, California. The proposed NBC Coastal Campus would include a mix of instructional and administrative facilities that would provide for indoor classroom and tactical training instruction, and equipment use, maintenance, and storage. The Proposed Action would include construction, operation, and maintenance of military construction projects (MILCONs). This would include 25 projects constructed over a 10-year period at a cost of approximately \$700 million, providing over approximately 1.5 million square feet of facilities.

The Proposed Action is needed due to lack of facilities and space to support NSWC's administrative, logistics, and classroom and tactical instruction functions. NSWC and its subordinate Commands are located at five separate installations of NBC. On those installations, many of the facilities are functionally obsolete and would not meet current or future requirements with expansion and renovation. Many of these facilities were built during the World War II era and are temporary or pre-engineered facilities built as a short-term solution to meet a specific but emerging requirement until a MILCON provides a permanent solution. At NAB Coronado, NSWC and subordinate Commands are spread throughout 60 facilities that are divided by State Route (SR) 75; are undersized and poorly configured facilities; and do not offer primacy (primary use), privacy, or proximity, thus, eliminating the potential to achieve effective Command and Control and organizational synergy. The Navy seeks to expand the naval campus at the Silver Strand Training Complex (SSTC) and redistribute personnel from Naval Air Station North Island (NASNI) and Naval Amphibious Base (NAB) Coronado.

Project Location

NBC is a group of eight Navy installations in the San Diego area, three of which could be included in the Coastal Campus development: NASNI, NAB Coronado, and SSTC-South.

NASNI is located just northwest of and adjacent to the City of Coronado. The installation is bounded by San Diego Bay on the north and east, the Pacific Ocean on the west, and the City of Coronado to the south. Primary on-installation access is via SR-282, by way of the Coronado Bay Bridge (SR-75).

NAB Coronado is located on the northern portion of the Silver Strand, bounded by San Diego Bay on the north, east, and south and the Pacific Ocean on the west. NAB Coronado is a primarily developed area with access provided via SR-75; which bisects the installation into two separate locations (Bay Side and Ocean Side).

SSTC is located adjacent to the southern border of the City of Coronado and adjacent to the northern border of the City of Imperial Beach, with San Diego Bay to the east and the Pacific Ocean to the west. SSTC is divided into two noncontiguous areas: SSTC-North and SSTC-South. SSTC-North includes land areas on the northern half of the Silver Strand peninsula and adjacent nearshore waters of the Pacific Ocean. SSTC-South includes land on the southern end of the Silver Strand peninsula and adjacent nearshore waters of the Pacific Ocean. SSTC-North and SSTC-South are separated by Silver Strand State Beach, which is owned by California Department of Parks and Recreation.

Analysis Scenarios

This document evaluates traffic facilities for three Proposed Action alternatives, with one to three homeported aircraft carriers. The three project alternatives were evaluated and compared to a no-build

alternative to determine the Proposed Action's impact on the study area. The following scenarios were analyzed as part of this study:

Existing Conditions

When data was being collected for the study intersections, either one or zero carrier vessels nuclear (CVNs) were in port, depending on the location of the count. For the intersections that did not have a carrier in port at the time of data collection, the collected traffic counts were adjusted to forecast traffic volumes so that all of the existing data would reflect one CVN in port. Trips were also applied to the Existing Condition with one CVN in port to estimate Existing Conditions with two and three (with staggered work hours) carriers in port based on methodology established in the *Final Traffic Study for the Supplemental Environmental Impact Statement for Developing Home Port Facilities for Three NIMITZ-Class Aircraft Carriers in Support of the U.S. Pacific Fleet*, dated May 2008, referred to as the "Home Port for Three Carriers Study" for the remainder of this report.

Year 2024 Conditions

Year 2024 is the year at which all proposed project construction is assumed to be completed and the new facilities are fully operational. The Year 2024 roadway network is assumed to be the same as in the Existing Condition. At any given time, the number of CVNs present at NASNI can fluctuate depending on the deployment schedule, but would never exceed three CVNs. As such, the traffic was analyzed with the following number of CVNs in port:

- One CVN in port
- Two CVNs in port
- Three CVNs in port (with staggered work hours)

Year 2040 Conditions

Year 2040 is the future year that represents a horizon year conditions, approximately 30 years from existing conditions. The Year 2040 roadway network is assumed to be the same as in the Existing Condition and is consistent with adjacent City-adopted community plans. Similar to the Year 2024 conditions, the traffic was analyzed with the following number of CVNs in port:

- One CVN in port
- Two CVNs in port
- Three CVNs in port (with staggered work hours)

For each of these study years a No-Action Alternative was analyzed. Under no-action conditions, it is assumed that the NBC Coastal Campus project would not take place and no construction or operational trips relating to the NBC Coastal Campus project would be in effect. Background growth and roadway network improvements independent of the Proposed Action would still occur.

For Year 2024 and Year 2040 study scenarios, three project alternatives (Alternative 1, 2, and 3) were analyzed. These project alternatives were compared to the No Action Alternative to determine the Proposed Action's impact on the study area.

Alternative 1 (SSTC-South Alternative) and Alternative 2 (SSTC-South Expanded Footprint Alternative) would have all of the proposed facilities within the expanded SSTC-South training site. The relocation of personnel from NASNI and NAB Coronado would be the same for these alternatives, but the layout of the facilities within SSTC-South would be different.

Alternative 3 (Multi-Installation Alternative) would have the proposed facilities split between NASNI, NAB Coronado, and SSTC-South, resulting in a different personnel distribution than the other two alternatives.

Trends and Historical Data

Traffic in the study area has historically been an issue and is influenced by tourism, development or redevelopment, and military operations. Data was collected from several transportation-related sources to help understand the historical trends in the area. The following summarizes key trends that were identified:

- Daily and peak-hour traffic volumes on the San Diego-Coronado Bridge have remained fairly constant since the toll removal in 2002.
- Summer months (June through September) have a noticeably higher volume on the San Diego-Coronado Bridge and Silver Strand Boulevard than the rest of the year.
- Daily and peak-hour traffic volumes on Silver Strand Boulevard have been declining since 2004.
- Peak-hour traffic volumes on Third and Fourth Streets in the City of Coronado have remained fairly constant since the NASNI gate improvements in 2006.
- Historical gate counts for traffic entering NASNI have remained fairly constant since 1995.
- Travel time between the toll both at the San Diego-Coronado Bridge and the entrance to NASNI was reduced by 18% (inbound) in the morning and 7% (outbound) in the afternoon with implementation of the new Main gate configuration at NASNI.
- Transit ridership has decreased in recent years and has significantly decreased since 2000.
- Ferry ridership averaged about 212 people, or 50% of capacity, in 2006 before it discontinued direct access to NASNI.
- The population in Coronado peaked in 1990 near 27,000 and has since returned to a population near 19,000 people. The projected population in Coronado by 2030 is approximately 31,000 people.
- It is difficult to firmly substantiate traffic patterns in the area, as traffic fluctuates seasonally and with military operations.

See Appendix A for more detailed trend analysis. Also note that population forecasts vary by source. Population projections by SANDAG show a population of only 27,937 by Year 2050.

2.0 METHODOLOGY

The following section describes the methodology used to estimate the traffic resulting from varying CVNs in port, forecast traffic volumes in the study area, complete the analysis process, and determine significant impacts.

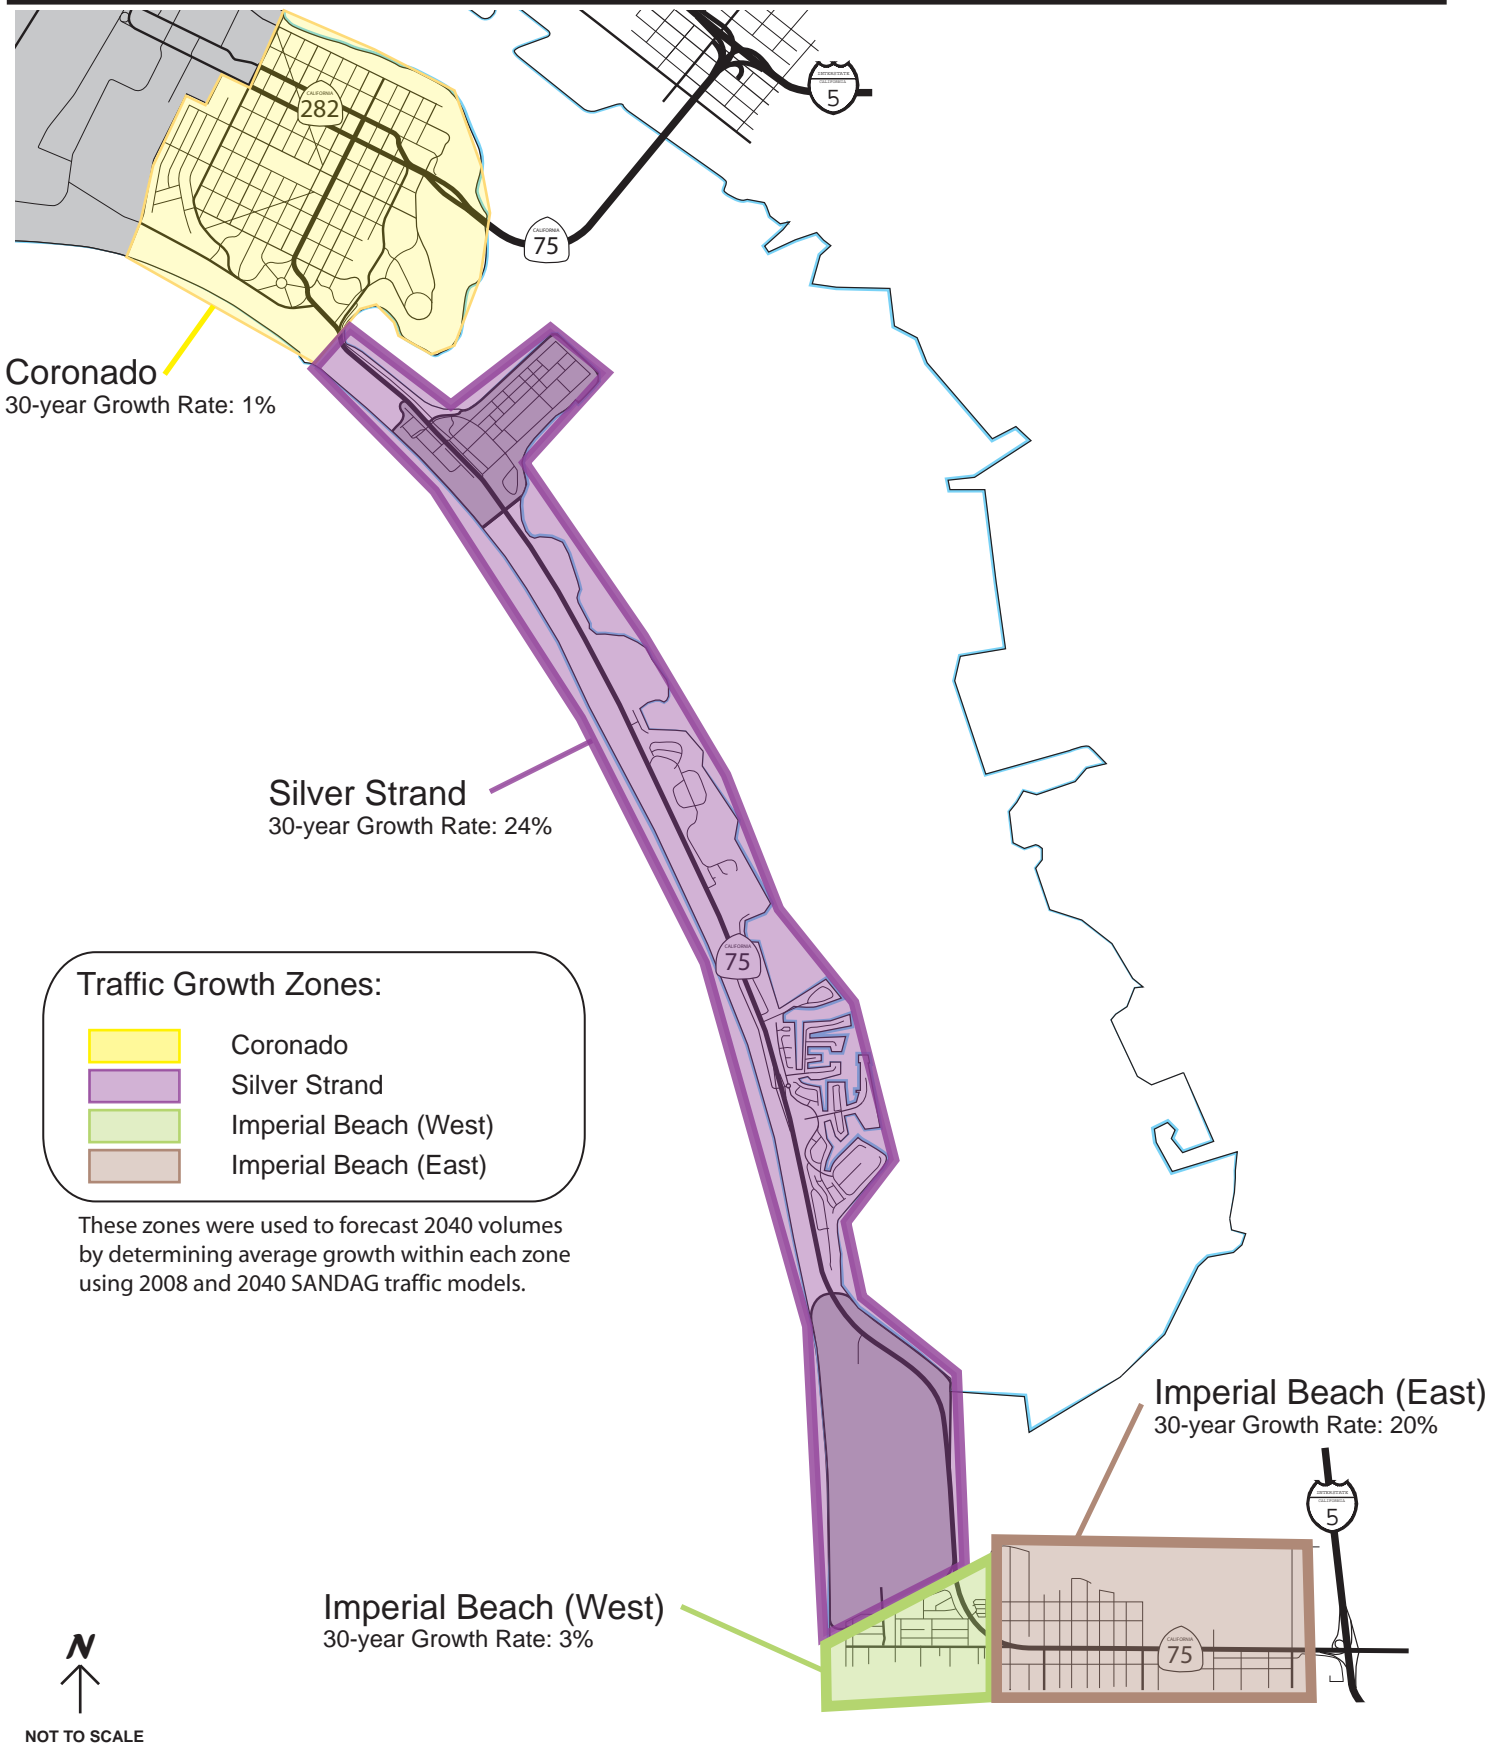

Forecast Traffic Volumes

To generate Year 2040 volumes from existing volumes, an initial comparison of 2008 and 2040 SANDAG Series 12 traffic forecast models was performed. The traffic model forecasts obtained from SANDAG are provided in **Appendix B**. After determining the traffic growth on individual roadways between the 2008 and 2040 traffic models, the study area was divided into four major zones and an average growth was determined for each zone. Zone boundaries were determined by the roadway characteristics and adjacent land uses. These zones are illustrated in **Figure 2-1** and the growth associated with each zone as determined from the model comparison is also shown on the figure. This approach to forecasting future volumes reflects the general growth of an area for a 30-year projection timeframe instead of individual roadway fluctuations. The area growth factors shown in the figure were applied to the existing intersection volumes to estimate Year 2040 turning movement volumes.

To determine Year 2024 traffic volumes, linear interpolation was used between the existing scenario and the Year 2040 scenario. Specifically, the growth in volumes between the existing and Year 2040 scenarios was assumed to be distributed equally for each year. The yearly increase was then multiplied by the number of years difference between Year 2024 and the existing year to estimate Year 2024 baseline volumes.

To ensure that reasonably foreseeable projects in the area are included in the Year 2024 traffic volumes, known projects were identified and added to existing volumes to be compared to the forecasted Year 2024 volumes. These cumulative projects are defined as projects within the study area that have been approved but are not yet generating trips. These projects are assumed to be open to the public by the time the Proposed Action is built out, Year 2024. The volumes for the cumulative projects are typically captured in traffic forecast models, but not in the years between the existing condition and the horizon year condition. For this project, two cumulative projects have been identified that was applied to the network, the Hotel Del Coronado expansion and the Bernardo Shores residential development. At locations where the existing-plus-cumulative project traffic volumes exceeded the model-based Year 2024 forecasted volumes, the existing-plus-cumulative project volumes were used. Otherwise, the previously described Year 2024 forecast volumes were used. While no other projects were identified at the time the study was prepared, new projects will arise before build out of this project is complete. Future projects in Coronado and Imperial Beach should use information from this study as a cumulative project for future projects to help forecast traffic operations in the near-term.

Traffic at NBC fluctuates depending on the number of CVNs in port and, therefore, this study evaluates conditions with varying number of CVNs in port. The CVN forecast volume methodology is consistent with the Home Port for Three Carriers Study and contained in **Appendix C**. Traffic counts were obtained when zero or one CVN was in port. Thus, the forecast methodology was used to develop traffic volumes for when two and three carriers are in port for existing, Year 2024, and Year 2040 study scenarios.

Analysis Process

To analyze the operations of both signalized and unsignalized intersections, Synchro 8 (Trafficware) was used for the analysis. Synchro 8 uses the methodologies outlined in the *Highway Capacity Manual (HCM)* published by Transportation Research Board. The modeling process has several variables that can be adjusted to reflect realistic conditions at the intersections being analyzed. Some assumptions made during the analysis process include:

- Signal timing parameters were obtained from Caltrans when applicable and otherwise optimized using Synchro software for Existing conditions.
- Signal timing parameters were kept consistent for all future and Plus Project Conditions.
- The peak hour factors (PHF) obtained from the traffic counts were used for all scenarios.
- The industry standard of 2% of traffic being considered heavy vehicles was used for all movements on all scenarios. More discussion on this assumption is provided in Section 7.0.

Intersections

The *HCM* establishes procedures to evaluate highway facilities and rate their ability to process traffic volumes. The terminology "level of service" is used to provide a qualitative evaluation based on certain quantitative calculations, which are related to empirical values.

The LOS for signalized intersections is defined in terms of delay, specifically, stated in terms of the average control delay per vehicle for the peak 15-minute period within the hour analyzed. The average control delay includes initial deceleration delay, queue move-up time, and final acceleration time in addition to the stop delay. The LOS for unsignalized intersections is determined by the computed or measured control delay and is defined for each minor movement. At an all-way stop control intersection, the delay reported is the average control delay of the intersection. At a one-way or two-way stop control intersection, the delay reported represents the worst movement. The criteria for the various levels of service designations are provided in **Table 2-1**.

Table 2-1. LOS Criteria for Intersections

LOS	Signalized	Unsignalized	Description
	Control Delay (sec/veh) (a)	Average Control Delay (sec/veh) (b)	
A	≤10.0	≤10.0	Operations with very low delay and most vehicles do not stop.
B	>10.0 and ≤20.0	>10.0 and ≤15.0	Operations with good progression but with some restricted movement.
C	>20.0 and ≤35.0	>15.0 and ≤25.0	Operations where a significant number of vehicles are stopping with some backup and light congestion.
D	>35.0 and ≤55.0	>25.0 and ≤35.0	Operations where congestion is noticeable, longer delays occur, and many vehicles stop. The proportion of vehicles not stopping declines
E	>55.0 and ≤80.0	>35.0 and ≤50.0	Operations where there is significant delay, extensive queuing, and poor progression.
F	>80.0	>50.0	Operations that are unacceptable to most drivers, when the arrival rates exceed the capacity of the intersection.

Notes:

- (a) 2010 Highway Capacity Manual, Chapter 18, Page 6, Exhibit 18-4
- (b) 2010 Highway Capacity Manual, Chapter 19, Page 2, Exhibit 19-1

Within the Cities of Coronado, Imperial Beach, and San Diego, all intersections are expected to operate at LOS D or better, as shown in the City of Coronado General Plan Circulation Element (18 July 2012), the City of Imperial Beach General Plan/LCP (October 2010), and the City of San Diego Significance Determination Thresholds, (January 2007).

SR-75 is a Caltrans-owned facility. Caltrans “endeavors to maintain a target LOS at the transition between LOS C and LOS D” on its facilities, but recognizes this may not always be feasible. Since each of the three local jurisdictions within the study area has LOS D as its minimum acceptable operations, intersections along SR-75 would also use LOS D as minimum acceptable operations.

Intersecting Lane Vehicle (ILV) Methodology

Per Caltrans District 11 requirements, intersection analysis must be performed at each local street interchange affected by a project using the intersecting lane vehicle (ILV) procedure. This evaluation process is discussed in further detail in the Caltrans Highway Design Manual Topic 406, page 400-30. The ILV analysis is used to estimate the capacity of a signalized intersection when the phasing is relatively simple. An intersection is thought to be at capacity when the ILV is 1,500 vehicles per hour.

Table 2-2 describes the traffic flow conditions of ramp intersections at various levels of operations.

Table 2-2. ILV Criteria at Ramp Intersections

ILV/hr (a)	Result	Description
< 1200	Below Capacity	Stable flow with slight, but acceptable delay. Occasional signal loading may develop. Free mid-block operations.
1200 – 1500	Approaching Capacity	Unstable flow with considerable delays possible. Some vehicles occasionally wait two or more cycles to pass through the intersection. Continuous backup occurs on some approaches.
> 1500	Above Capacity	Stop-and-go operation with severe delay and heavy congestion ^(b) . Traffic volume is limited by maximum discharge rates of each phase. Continuous backup in varying degrees occurs on all approaches. Where downstream capacity is restrictive, mainline congestion can impede orderly discharge through the intersection.

Notes:

Based on the Caltrans Highway Design Manual, Table 406 “Traffic Flow Conditions at Intersections at Various Levels of Operation”, page 400-33.

(a) = Intersecting Lane Vehicles/hour (ILV/hr)

(b) = The amount of congestion depends on how much the ILV/hr value exceeds 1500. Observed flow rates will normally not exceed 1500 ILV/hr, and the excess will be delayed in a queue.

Roadway Segments

The City of Coronado classifies its roadways into one of the following four categories based on the City of Coronado’s General Plan Circulation Element (July 2012):

- Major Arterial
- Minor Arterial
- Collector Street
- Local Street

Classification is determined based on the importance and purpose of the traffic movements and volumes on a particular street.

The City of Imperial Beach classifies its roadways into one of the following six categories based on its General Plan/LCP (2010):

- Six-Lane Prime Arterial
- Four-Lane Major Street
- Four-Lane Collector
- Three-Lane Collector
- Two-Lane Collector
- Residential Street

The City of San Diego classifies its roadways into one of the following four categories and provides LOS thresholds for each classification based on the City of San Diego General Plan (2008):

- Arterial
- Major Street
- Collector Street
- Local Street

Traffic patterns in Coronado are unique in that peak hours are spread over a longer time period because of the Navy's staggered work times and because of heavy tourism traffic that occurs outside of peak hours. **Figures 2-2 and 2-3** illustrate an average daily trip distribution along 3rd Street and 4th Street in the City of Coronado where the morning and afternoon peaks begin earlier than normal and last longer than normal. On 3rd Street the peak volumes start around 0500 and lasting a couple hours in the morning. On 4th Street the peak volumes start around 1400 and last until about 1630. During the rest of the day traffic on 3rd and 4th Streets are moderate in volume and fairly consistent.

Traffic in Imperial Beach is also influenced by military operations and has unique travel patterns that can be somewhat consistent throughout the day. Peak periods that are lengthened by military traffic arriving and departing before and after the typical commute times, and a mix of military, commercial, school, and residential traffic make for fairly consistent volumes throughout the day. **Figure 2-4** illustrates an average daily trip distribution along 13th Street in Imperial Beach where traffic volumes stay fairly consistent between 0600 and 1800.

Traditional roadway segment analysis uses theoretical capacities for roadways depending on the classification and does not take into account grades of roadway, design features, number of traffic signals along the roadway, or other factors that influence operations. Furthermore, these capacities assume a traditional distribution of traffic over the day, including a typical 1-hour morning and afternoon peak hour. Thus, rather than looking at theoretical analysis of roadway segments using an average daily traffic (ADT) count and a defined classification, the respective segment's functionality can be determined by looking at the operations of the upstream and downstream intersections during the peak periods. If the intersections at both ends of a roadway segment operate effectively, it can be assumed that the segment of roadway has adequate capacity. Conversely, if the intersections at one or both ends of a roadway segment operate poorly, it can be assumed that the segment experiences volumes above its capacity. Therefore, roadway segment analysis was not conducted as part of this study as intersection operations govern the traffic flow along the roadways in this area. Roadway segment volumes are provided in **Appendix D** for reference purposes only.

Count obtained in October 2012 by National Data and Surveying Services

Significance Determination

To determine the Proposed Action's impacts, San Diego Traffic Engineering Council/Institute of Transportation Engineers (SANTEC/ITE) guidelines were used at all locations. SANTEC/ITE guidelines were developed to promote "cooperation among the Cities, Caltrans, and the County of San Diego to create a region-wide standard for determining traffic impacts in environmental reports." These guidelines provide acceptable threshold standards to determine the significance of project impacts to intersections and arterial segments. At intersections, the measurement of effectiveness (MOE) is based on allowable increases in delay. At intersections that are expected to operate at LOS E or F, the allowable increase in delay is two seconds. If vehicle trips attributed to a project cause the delay at an intersection to increase by more than the allowable threshold, this would be considered a significant project traffic impact that requires mitigation.

Table 2-3 shows the criteria for determining levels of significance at intersections using SANTEC/ITE guidelines.

Table 2-3. Significance Criteria

Facility	Measurement of Effectiveness (MOE)	Significance Threshold ^(a)
Intersection	Seconds of Delay	>2.0 seconds at LOS E or F

(a) = Significance threshold applies only when the intersection operates at LOS E or F. Otherwise, an impact occurs if an intersection operating at LOS D or better without project traffic operates at LOS E or F with the addition of project traffic.

3.0 EXISTING CONDITIONS

The number of CVNs in port at NASNI has a direct relation to traffic volumes within the study area. Thus, existing baseline conditions were established with one, two, and three CVNs in port. However, scenarios with three CVNs in port were not analyzed since the associated requirement to stagger work hours would result in peak hour traffic volumes that are less than the two CVN scenarios. Staggering of work hours with three CVNs in port was a requirement previously established during the decision to homeport a third CVN at NASNI and remains in place at the time of this study. Since work hours are not required to be staggered when two CVNs are in port, the peak hour volume essentially doubles with the second CVN. When there are three CVNs in port, the shifts for each CVN are spread out approximately an hour apart so that commute traffic is spread over a three-hour period instead of tripling the demand over a single peak hour. As a result, the single peak hour volume would be less with three CVNs in port than it would be when two CVNs in port, although the period with commute traffic would last longer with three CVNs in port. The traffic analysis performed in this study looks at the single highest morning and afternoon peak hour. Traffic operations under scenarios with two CVNs in port would represent the highest volumes. Scenarios with one CVN in port are a close representation of operations when there are three CVNs in port. Thus, analysis of three CVNs was not performed. Traffic volumes for scenarios with three CVNs in port are provided in **Appendix E** to allow comparison in volumes with other scenarios.

Study Intersections

The 33 study intersections, shown in **Table 3-1**, were selected for analysis based on their locations along key travel ways and proximity to NBC installations. **Figure 3-1** displays the location of the study intersections. **Figure 3-2** shows the existing geometrics at each of the study intersections.

Road Network

The following provides a description of the existing street system within the vicinity of the study area.

San Diego-Coronado Bay Bridge (SR-75) is classified and functions as a five-lane freeway. The traffic lanes on the bridge are separated by a movable median, which allows for three westbound traffic lanes in the morning and three eastbound traffic lanes in the afternoon and evening. The approach on each side of the bridge contains three lanes. An out-of-service toll plaza sits on the west side of the bridge and serves as a traffic calming device for vehicles entering Coronado. The San Diego-Coronado Bay Bridge is also known as SR-75. The posted speed limit is 50 miles per hour (mph).

3rd Street is classified and functions as a westbound, one-way, three-lane principal arterial between Pomona Avenue and Alameda Boulevard. Third Street is also known as SR-75 between Pomona Avenue and Orange Avenue, and SR-282 between Orange Avenue and Alameda Boulevard. Sidewalks and curbs are located on both sides of the street for the entire length. No parking is allowed on Third Street east of Orange Avenue. An entrance-only NASNI gate is located at the west end of Third Street. This street serves as the main route from the San Diego-Coronado Bay Bridge to NASNI. The posted speed limit is 25 mph.

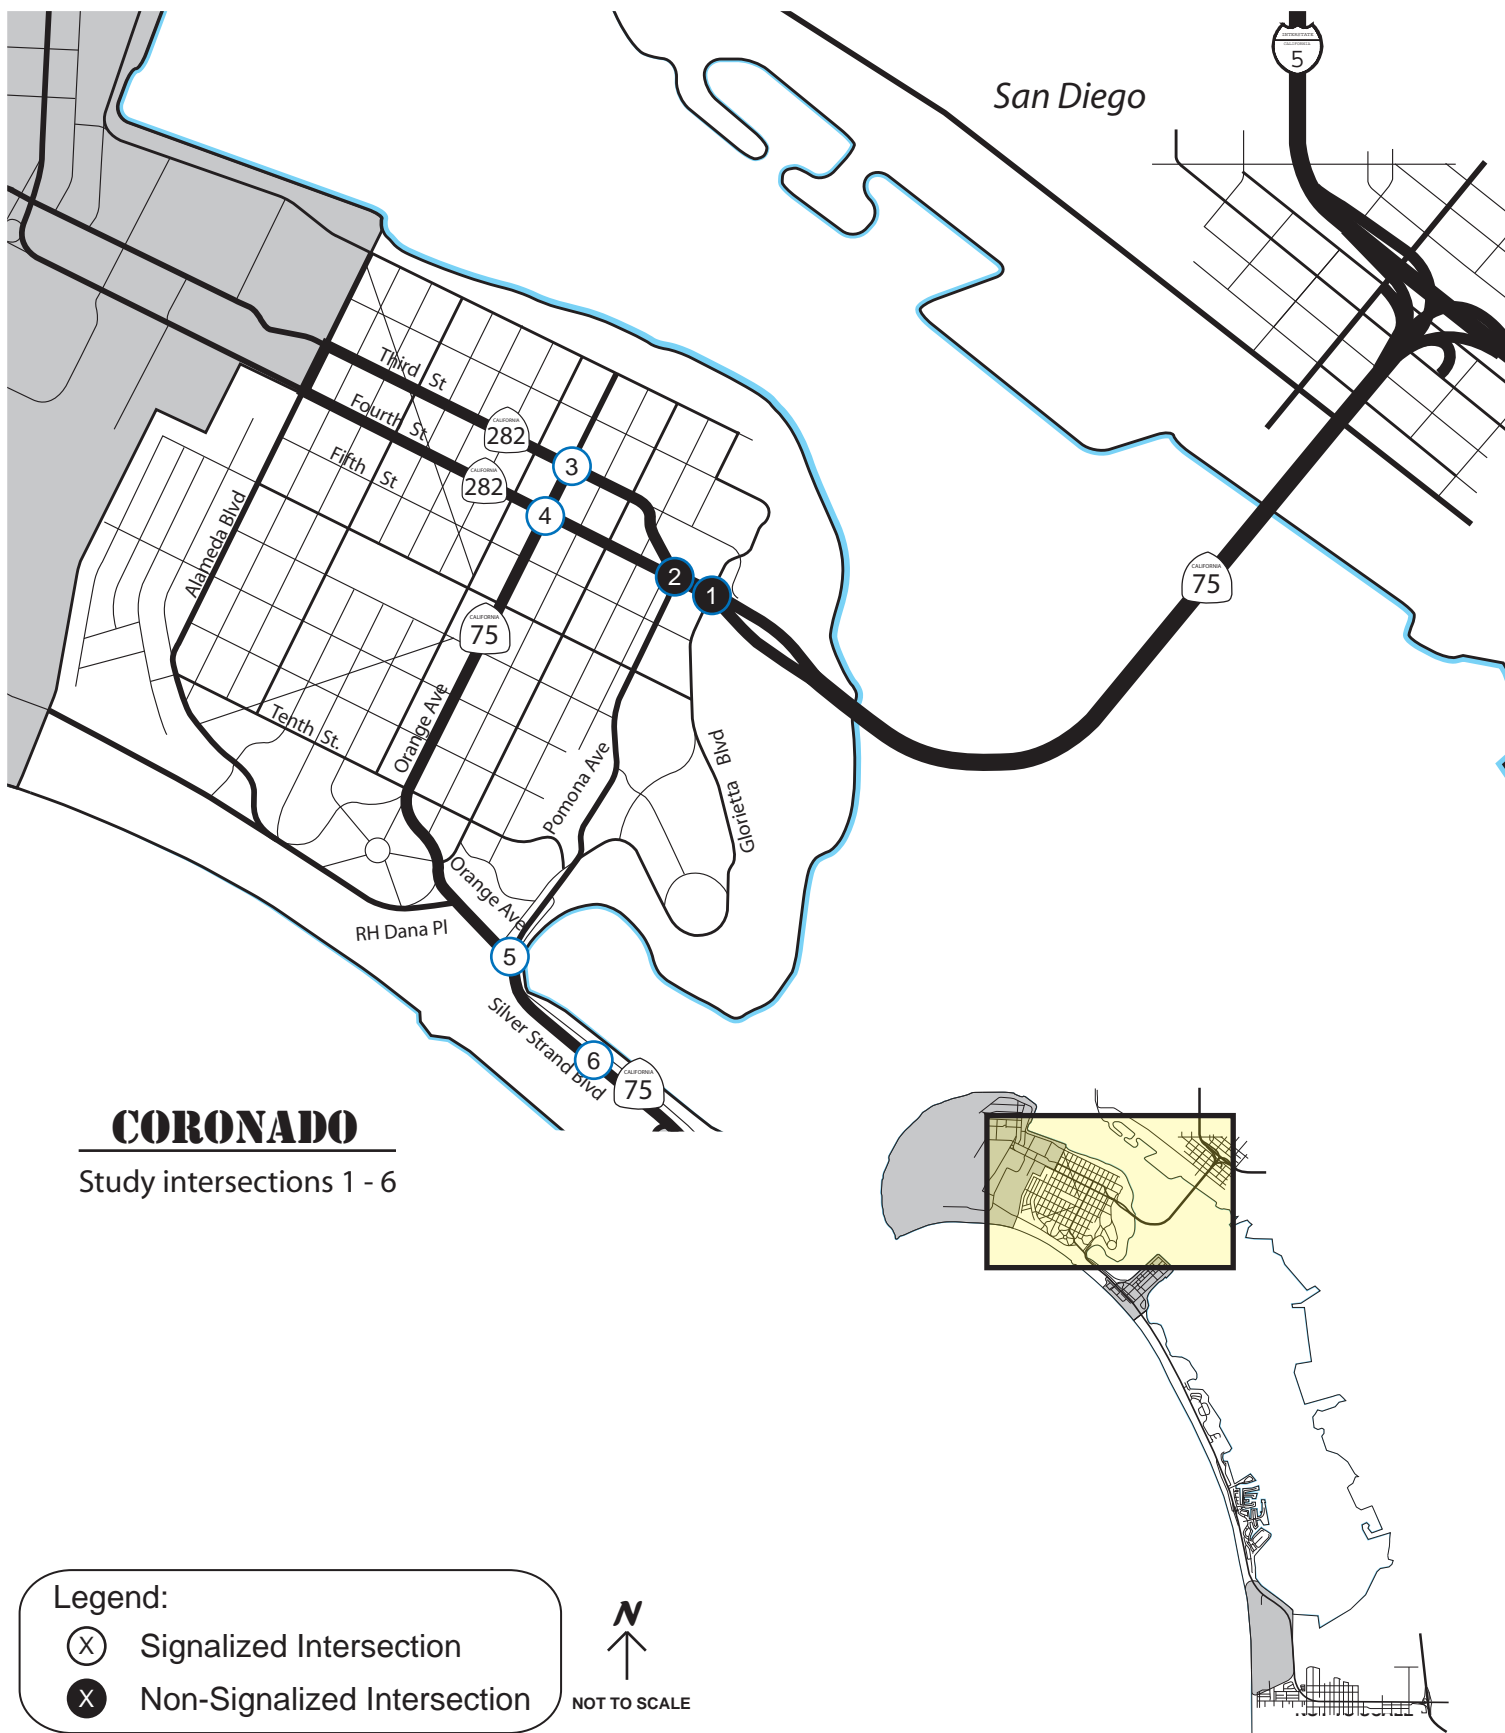

4th Street is classified and functions as an eastbound, one-way, three-lane principal arterial between Alameda Boulevard and Pomona Avenue. Sidewalks, curbs, and parallel-parking spaces are located on both sides of the street for the entire length. Fourth Street is also known as SR-282 between Alameda Boulevard and Orange Avenue, and as SR-75 between Orange Avenue and Pomona Avenue. An exit-only NASNI gate is located at the west end of the street. This street serves as the main route from NASNI to the San Diego-Coronado Bay Bridge. The posted speed limit is 25 mph.

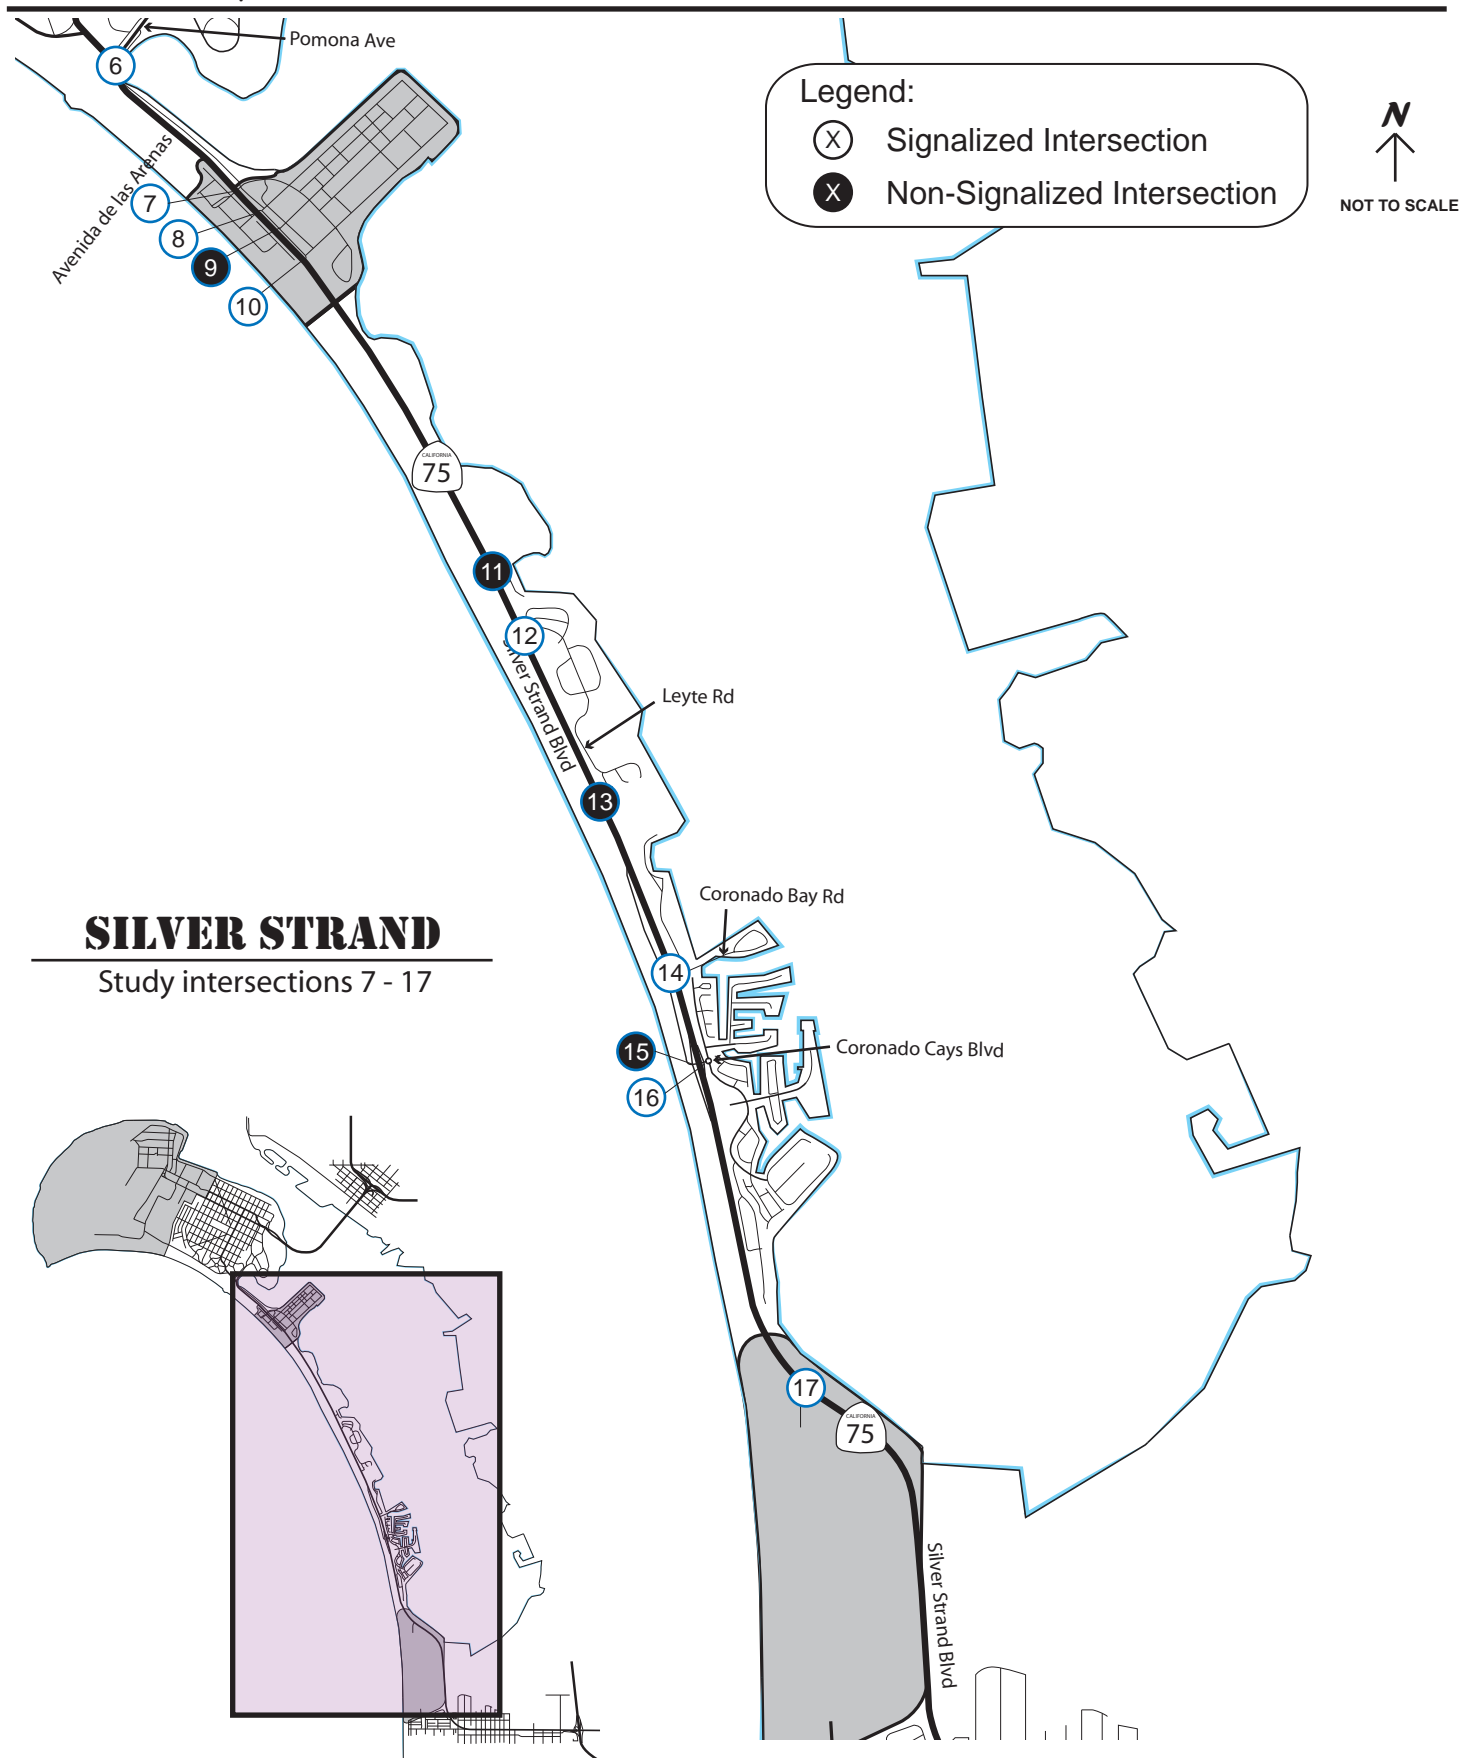

Table 3-1. Study Intersections

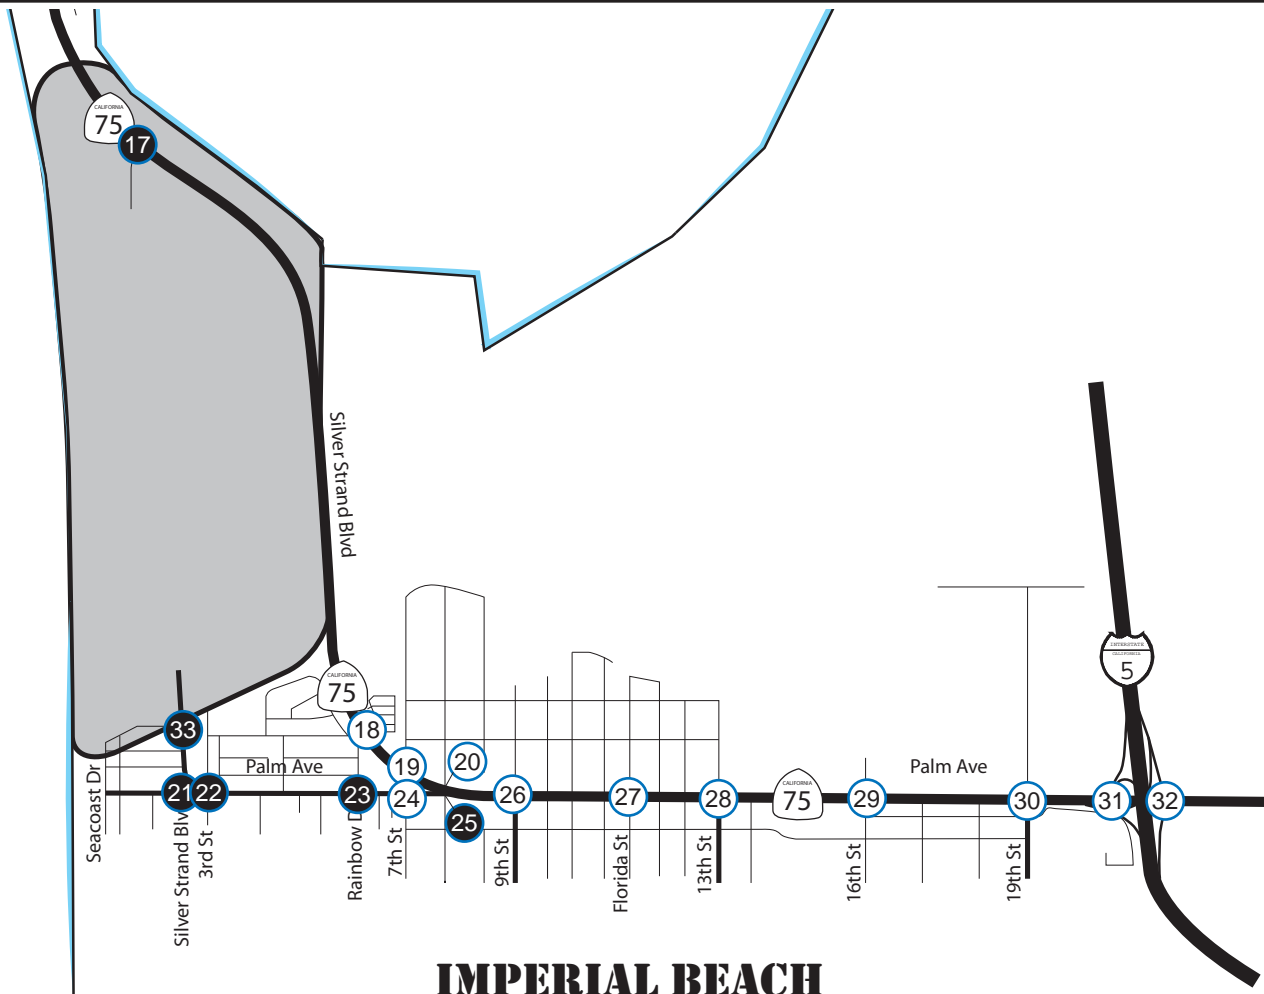

Intersection		Traffic Control (a)	Jurisdiction (b)
1	Glorietta Blvd and Fourth St (SR-75)	One-Way Stop	Caltrans/Coronado
2	Fourth St (SR-75) and Pomona Ave	One-Way Stop	Caltrans/Coronado
3	Orange Ave (SR-75) and Third St (SR-75)	Signal	Caltrans/Coronado
4	Orange Ave (SR-75) and Fourth St (SR-75)	Signal	Caltrans/Coronado
5	Silver Strand Blvd/Orange Ave (SR-75) and Pomona Ave	Signal	Caltrans/Coronado
6	Silver Strand Blvd (SR-75) and Avenida De Las Arenas	Signal	Caltrans/Coronado
7	Silver Strand Blvd (SR-75) and Rendova Rd	Signal	Caltrans/Coronado
8	Silver Strand Blvd (SR-75) and Tarawa Rd	Signal	Caltrans/Coronado
9	Strand Way and Guadalcanal Rd	Two-Way Stop	Navy/Coronado
10	Silver Strand Blvd (SR-75) and Tulagi Rd	Signal	Caltrans/Coronado
11	Silver Strand Blvd (SR-75) and Fiddler's Cove Driveway	One-Way Stop	Caltrans/Coronado
12	Silver Strand Blvd (SR-75) and Leyte Rd	Signal	Caltrans/Coronado
13	Silver Strand Blvd (SR-75) and Attu Ave	One-Way Stop	Caltrans/Coronado
14	Silver Strand Blvd (SR-75) and Coronado Bay Rd	Signal	Caltrans/Coronado
15	Southbound Silver Strand Blvd (SR-75) and Coronado Cays Blvd	All-Way Stop	Caltrans/Coronado
16	Northbound Silver Strand Blvd (SR-75) and Coronado Cays Blvd	Signal	Caltrans/Coronado
17	Silver Strand Blvd (SR-75) and Hooper Blvd	Signal	Caltrans/Navy
18	Silver Strand Blvd (SR-75) and Rainbow Dr	Signal	Caltrans/ Imperial Beach
19	7th St and Silver Strand Blvd (SR-75)	Signal	Caltrans/ Imperial Beach
20	Silver Strand Blvd (SR-75) and Delaware St	Signal	Caltrans/ Imperial Beach
21	Driveway/Silver Strand Blvd and Palm Ave	Two-Way Stop	Imperial Beach
22	3rd St and Palm Ave	All-Way Stop	Imperial Beach
23	Palm Ave and Rainbow Dr	One-Way Stop	Imperial Beach
24	7th St and Palm Ave	Signal	Imperial Beach
25	Delaware St and Palm Ave	One-Way Stop	Imperial Beach
26	9th St and Palm Ave (SR-75)	Signal	Caltrans/ Imperial Beach
27	Florida St and Palm Ave (SR-75)	Signal	Caltrans/ Imperial Beach
28	13th St and Palm Ave (SR-75)	Signal	Caltrans/ Imperial Beach
29	16th St and Palm Ave (SR-75)	Signal	Caltrans/San Diego
30	Saturn Blvd/19th St and Palm Ave (SR-75)	Signal	Caltrans/San Diego
31	Palm Ave (SR-75) and I-5 Southbound Exit Ramp	Signal	Caltrans
32	I-5 Northbound Ramps and Palm Ave (SR-75)	Signal	Caltrans
33	Silver Strand Blvd and YMCA Driveway	One-Way Stop	Imperial Beach

Notes:

- (a) Signal = Traffic signal;
One-Way Stop, Two-Way Stop, and All-Way Stop represent unsignalized intersections and the number of stop-controlled approaches.
- (b) Jurisdiction refers to the agency that is responsible for the operation and maintenance of the intersection. SR-75 is a California Department of Transportation (Caltrans) facility but side streets are within local jurisdictions so most intersections have shared responsibility.

Orange Avenue (SR-75) is classified and functions as a north/south, four-lane minor arterial between First Street and Third Street, and a four-lane principal arterial between Third Street and Pomona Avenue. Orange Avenue is also known as SR-75. The road has a wide, raised landscaped median for the entire length. This street has sidewalks, curbs, and parallel-parking spaces on both sides of the street for the entire length. The posted speed limit is 30 mph between First Street and Ninth Street, and 25 mph between Ninth Street and Pomona Avenue.

Silver Strand Boulevard (SR-75) is classified and functions as a north/south, four-lane principal arterial from Coronado Street to the City of Imperial Beach. The roadway is divided by three-beam barriers and primarily has a posted speed limit of 65 mph, but some portions are as low as 35 mph. Silver Strand Boulevard is also known as SR-75 south of Pomona Avenue. Parking is not allowed along Silver Strand Boulevard; however, a paved shoulder lane is available on both sides. There is a separate two-lane bike path to the east of the road that travels the entire length.

Palm Avenue is a six-lane prime arterial that transitions into a two-lane collector (Class III) in the westward direction. Between I-5 and 7th Street, Palm Avenue is a divided six-lane prime arterial with a speed limit of 40 mph and is also known as SR-75. Between 7th Street (where SR-75 and Palm Avenue split) and Rainbow Drive, Palm Avenue is a four-lane collector separated by a two-way left-turn lane. The speed limit in this section is 35 mph. The section of Palm Avenue between Rainbow Drive and 3rd Street is a two-lane collector separated by a two-way-left-turn lane, the speed limit in this section remains at 35 mph. West of 3rd Street, Palm Avenue is a two-lane undivided collector with a posted speed limit of 30 mph.

Traffic Volumes

Existing peak-hour turning movement volumes at the study intersections were collected in 2012. Traffic counts in the a.m. peak period were obtained between 6:00 and 8:00 a.m. and traffic counts in the p.m. peak period were obtained between 2:30 and 4:30 p.m. The existing traffic volume data is contained in **Appendix F**.

Traffic counts were not all performed on the same day and the number of CVNs in port at NASNI varied with one or zero on the different days that counts were performed. To account for differences in the number of CVNs in port during the day of the counts, adjustments were made to the count data acquired when zero CVNs were in port using the CVN forecast methodology contained in Appendix C. CVN traffic was applied to each of the intersections to establish existing conditions except the following locations which captured traffic data when one CVN was in port:

- Glorietta Boulevard at Fourth Street (SR-75)
- Pomona Avenue at Fourth Street (SR-75)
- Orange Avenue (SR-75) at Third Street (SR-75)
- Orange Avenue (SR-75) at Fourth Street (SR-75)
- Silver Strand Boulevard (SR-75) at Avenidas de las Arenas
- Silver Strand Boulevard (SR-75) at Rendova Road
- Silver Strand Boulevard (SR-75) at Tarawa Road
- Strand Way at Guadalcanal Road
- Silver Strand Boulevard (SR-75) at Tulagi Road

Existing volumes representing one CVN in port were adjusted using forecast methodology contained in Appendix A to determine the existing volume when two and three CVNs are in port.

Figures 3-3 and 3-4 show the Existing Conditions volumes with one and two CVNs in port, respectively. As previously explained, analysis was not performed for scenarios with three CVNs in port as volumes

would be equal to or less than when two CVNs are in port due to the requirement to stagger work hours. Volumes with three CVNs in port are provided in Appendix E.

Table 3-2 displays the LOS analysis results for the study intersections under Existing No Action Alternative Conditions. **Table 3-3** displays the ILV analysis results for the Palm Avenue and I-5 interchange under the Existing No Action Alternative scenario. **Appendix G** contains the LOS calculation worksheets and **Appendix H** contains the ILV calculation worksheets. The results of the analyses are summarized below.

Conditions with 1 Carrier Vessel Nuclear (CVN)

No-Action Conditions

Intersection Analysis

All intersections operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Ave (SR-75) & Fourth St (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #19 7th St & Silver Strand Blvd (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>PM peak (LOS F)</i> |

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange operate below capacity during both peak periods with one CVN in port.

Conditions with 2 Carrier Vessels Nuclear (CVN)

No-Action Conditions

Intersection Analysis

All intersections operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Ave (SR-75) & Fourth St (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #19 7th St & Silver Strand Blvd (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>PM peak (LOS F)</i> |

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange operate below capacity during both peak periods with two CVNs in port.

Table 3-2. Existing No-Action Intersection Analysis

INTERSECTION		1 CVN		2 CVNs

		PM	700	Below Capacity	704	Below Capacity

Notes:

Bold values indicate intersections operating above capacity.

4.0 ASSESSMENT OF PROPOSED ACTION

The Proposed Action has three alternatives that are being evaluated. Alternatives 1 and 2 both consolidate NSWC facilities to one location on SSTC-South. Alternative 3 would include all of the components as Alternatives 1 but would separate them across three installations: NAB Coronado, NASNI, and SSTC-South. This study analyzes the traffic impacts associated with each of the three alternatives and compares them to the No-Action alternative. In order to determine the traffic impacts for each alternative, trip generation and distribution was determined to quantify how much traffic each alternative will add or subtract from the roadway network, and where those trips will be added or removed. This section describes the methodology and assumptions used to determine traffic changes associated with each of the three Proposed Action alternatives.

Alternative 1

Road Network

The only roadway network change associated with Alternative 1 is implementation of P947, which would install a new entry control point at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. Improvements to the intersection would include adding an exclusive southbound right-turn lane, lengthening the northbound left-turn lane, and developing the west leg to become a four-lane road with two exit lanes and two receiving lanes and provide access to the new SSTC-South ECP. All other roadways and intersections within the study area would remain the same with the addition of Alternative 1.

Traffic Volumes

Although Alternative 1 assumes that all of the proposed Naval Special Warfare facilities will be located within the expanded SSTC training site, trip generation and distribution was determined for both NAB Coronado and SSTC as the proposed project will affect both locations.

It is anticipated that 3,045 personnel will relocate from NAB Coronado to SSTC with the construction of the project. The new vacancy within NAB Coronado will allow an increase of 1,000 personnel from outside sources. Also, the Naval Base Coronado Planning Department is expecting personnel fluctuations independent of the project that must be captured in the NAB Coronado trip generation (549 increase and 123 decrease). Further, it is expected that 191 personnel from locations outside of NAB Coronado will use the facilities at SSTC during the peak hours. No personnel would be relocated to or from NASNI with the addition of this project. The change in personnel associated with Alternative 1 is summarized in **Table 4-1**.

Table 4-1. Alternative 1 Personnel Changes

<i>NAB Coronado</i>	<i>+ / -</i>	<i>Number</i>
Existing Total Personnel at NAB (2012) ¹		5,182
<i>Planned increase in personnel by Year 2024</i> ²	(+)	549
Future Total Baseline Personnel at NAB (2024)		5,731
<i>Personnel from NAB relocating to SSTC-South with project</i> ³	(-)	3,045
<i>Personnel relocating elsewhere by Year 2024</i> ²	(-)	123
<i>Increase in personnel with area abandoned by project's personnel relocation</i> ⁴	(+)	1,000
Total Net Personnel at NAB with project		3,563
<i>Change in personnel at NAB with project build out</i>		<i>-1,619</i>

<i>SSTC-South</i>		<i>Number</i>
Existing NSW personnel at SSTC-South ¹		117
<i>NSW personnel to relocate to SSTC-South with project</i> ³	(+)	3,045
<i>Other personnel to use project training facilities</i> ⁵	(+)	191
Total personnel at SSTC-South with project ³		3,353
<i>Change in personnel at SSTC-South with project build out</i>		<i>3,236</i>

<i>NASNI</i>		<i>Number</i>
Existing NSW personnel at NASNI ⁶		30
<i>NSW personnel to relocate to NASNI with project</i> ³	(+)	0
Total NSW personnel at NASNI with project ³		30
<i>Change in personnel at NASNI with project build out</i>		<i>0</i>

Notes:

¹ Existing personnel numbers at NAB obtained from the Naval Base Coronado Pre-final Activity Overview Plan, dated September 2010.

² This estimate was provided by a Naval Special Warfare representative in January 2012 and based on information known at that time.

³ This value was obtained from a point paper established in February 2013 that reflected anticipated personnel changes with the build out of the NBC Coastal Campus.

⁴ This estimate was provided by a Naval Base Coronado representative and based on an analysis of the potential building space at NAB vacated by the project.

⁵ This value represents the use of training facilities that would be developed as part of the Coastal Campus project by users not part of Naval Special Warfare. This value was calculated by subtracting the existing and future Naval Special Warfare personnel from the total population anticipated at SSTC-South (3,353-117-3,045 = 191).

⁶ This estimate was provided by a Naval Special Warfare representative in May 2013 and based on information known at that time.

The project's trip generation was determined based on the change in personnel. It was determined that 4,048 daily trips would be removed from NAB Coronado with the addition of Alternative 1; 364 trips (328 in, 36 out) would be removed from the morning peak hour; and 405 trips (81 in, 324 out) would be removed from the afternoon peak hour. Further, it was determined that 8,090 daily project trips would be added to SSTC-South; 728 trips (655 in, 73 out) would be added during the morning peak hour; and 809 trips (162 in, 647 out) would be added during the afternoon peak hour. **Table 4-2** displays the trip generation for Alternative 1 for both the NAB Coronado and SSTC-South locations.

Trip distribution for Alternative 1 was determined for NAB Coronado and SSTC-South based on regional models prepared by SANDAG and by information obtained from the Navy. Initially, a SANDAG Series 12 Select Zone Model was prepared for both NAB Coronado and SSTC. Modifications were then made to the distribution patterns based on interactions between installations relating to NSW operations, location of military housing, and to provide consistent with previous studies in the area. **Figure 4-1** and **Figure 4-2** show the general trip distribution through the study area for NAB Coronado and SSTC, respectively. **Figure 4-3** and **Figure 4-4** show the distribution at each study intersection for NAB Coronado and SSTC, respectively.

The project's trip generation was combined with the distribution to determine the project trip assignment at each of the study intersections for the NAB Coronado and SSTC-South locations. **Figure 4-5** shows the Alternative 1 project trips associated with NAB Coronado. The trips are negative because they represent the amount of traffic that will be removed from NAB Coronado in accordance with the personnel fluctuations previously explained. **Figure 4-6** shows the SSTC-South Alternative 1 project trips and are positive values because trips are being added to the network. The NAB Coronado and SSTC-South Alternative 1 project trip assignments were added together to get the total project area Alternative 1 project trips, as shown in **Figure 4-7**.

Table 4-2. Alternative 1 Trip Generation Calculations

<i>NAB Coronado</i>	<i>Number</i>
<i>Existing NSW personnel at NAB¹</i>	5,182
Current daily vehicle trips generated for NAB (2.5 trips / person)²	12,955
<i>Change in personnel at NAB with project build out</i>	-1,619
Daily vehicle project trips generated for NAB (2.5 trips / person)²	-4,048
<i>Morning peak hour project trips for NAB³</i>	-364
<i>Inbound / Outbound</i>	(-328 in / -36 out)
<i>Afternoon peak hour project trips for NAB³</i>	-405
<i>Inbound / Outbound</i>	(-81 in / -324 out)
Resulting daily vehicle trips for NAB Coronado	8,908

<i>SSTC-South</i>	<i>Number</i>
<i>Existing NSW personnel at SSTC-South¹</i>	117
Daily vehicle trips generated for SSTC-South (2.5 trips / person) ²	293
Existing daily trips between SSTC-South and NAB Coronado (non-peak) ⁴	504
Current total daily vehicle trips for SSTC-South⁵	796
<i>Change in personnel at SSTC-South with project build out</i>	3,236
Daily vehicle project trips generated for SSTC-South (2.5 trips / person)²	8,090
<i>Morning peak hour project trips for SSTC-South³</i>	728
<i>Inbound / Outbound</i>	(655 in / 73 out)
<i>Afternoon peak hour project trips for SSTC-South³</i>	809
<i>Inbound / Outbound</i>	(162 in / 647 out)
Resulting daily vehicle trips for SSTC-South	8,886

Notes:

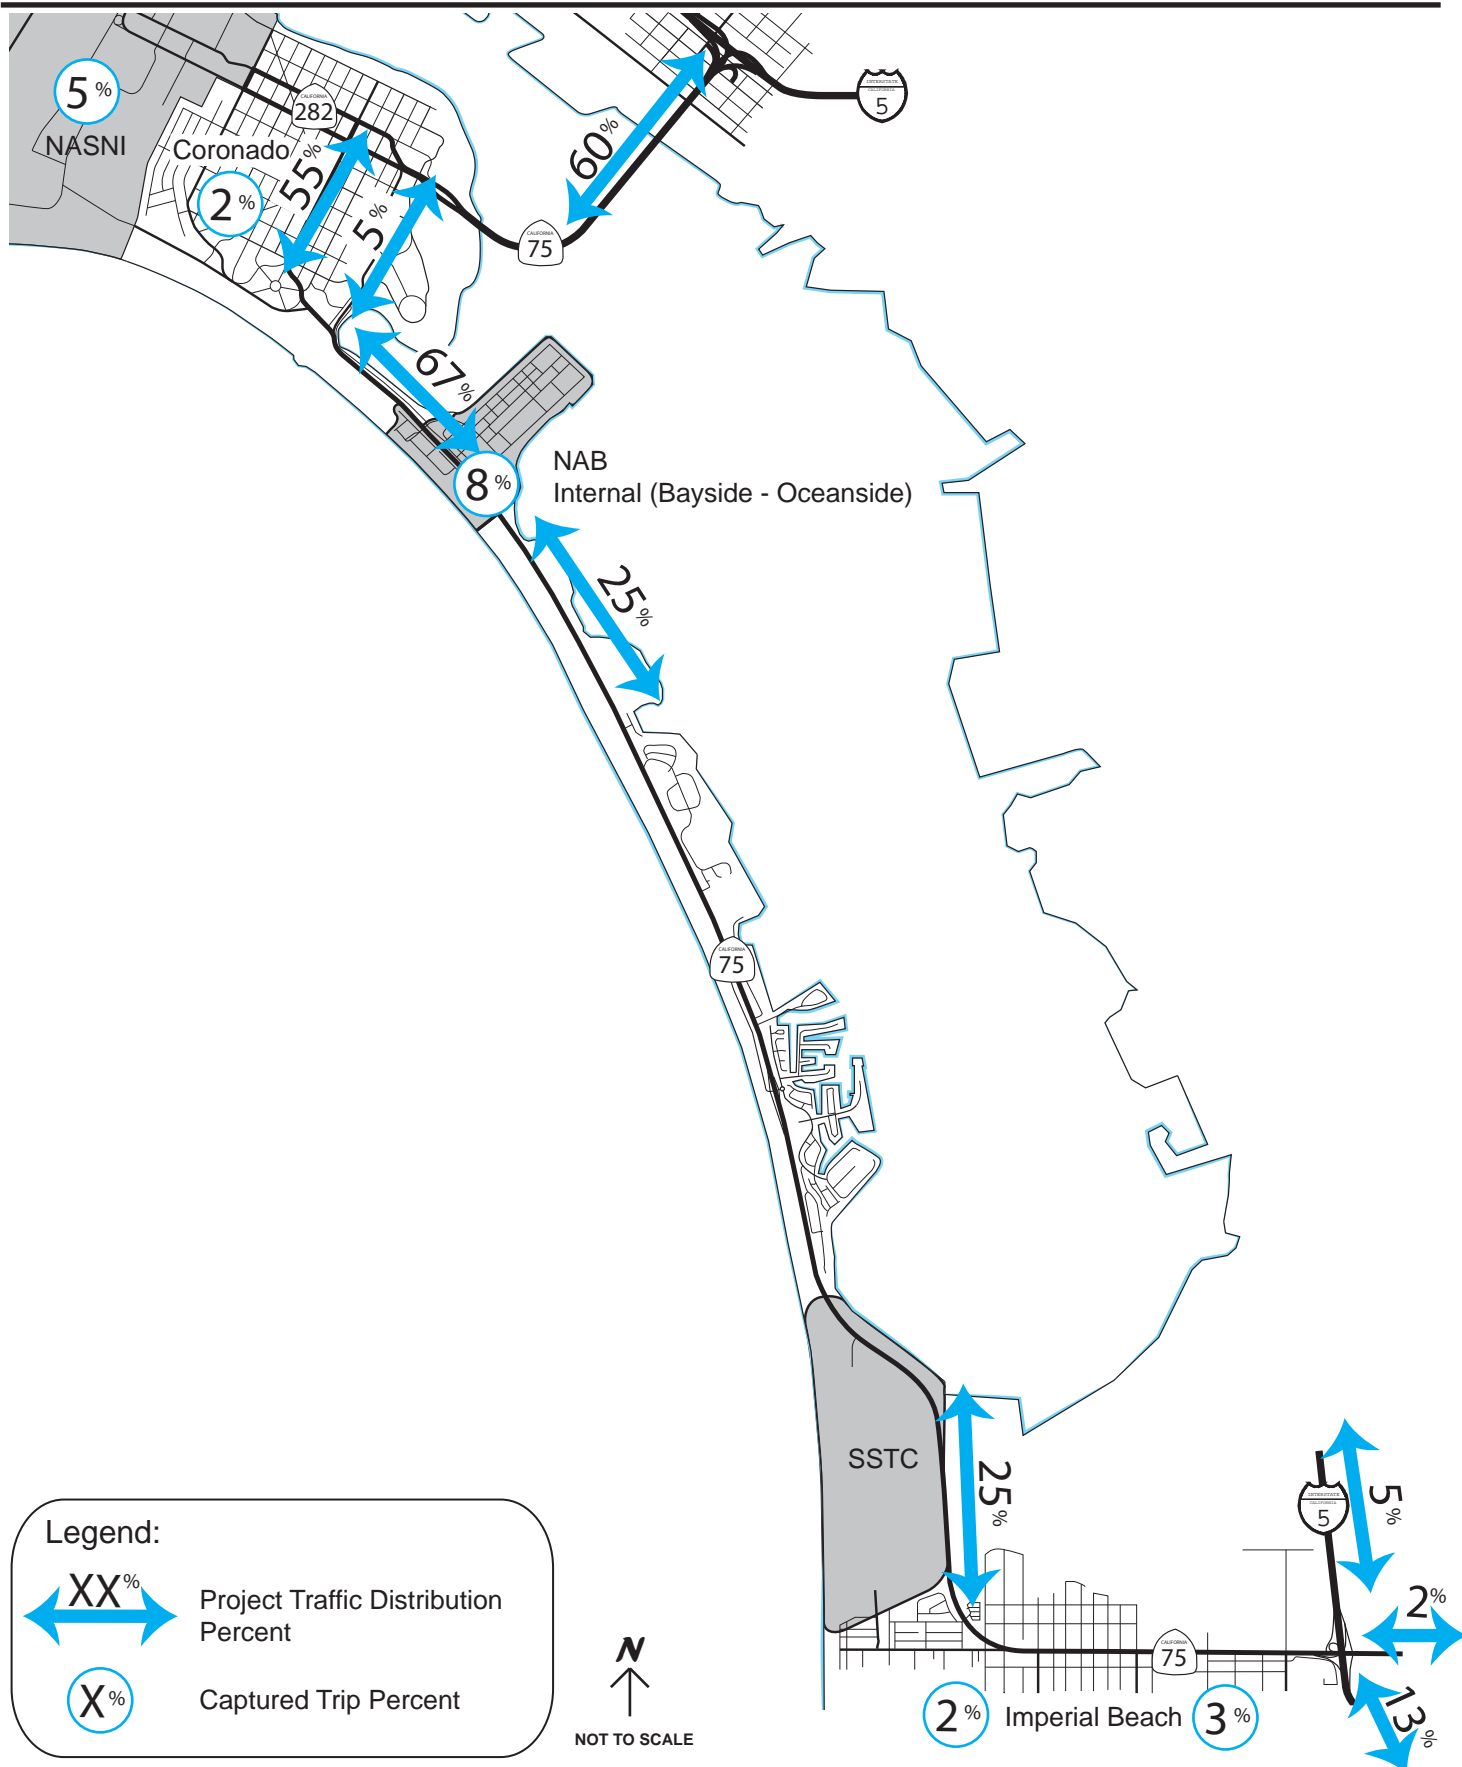

¹ Existing personnel numbers at NAB Coronado obtained from the Naval Base Coronado Pre-final Activity Overview Plan, dated September 2010.

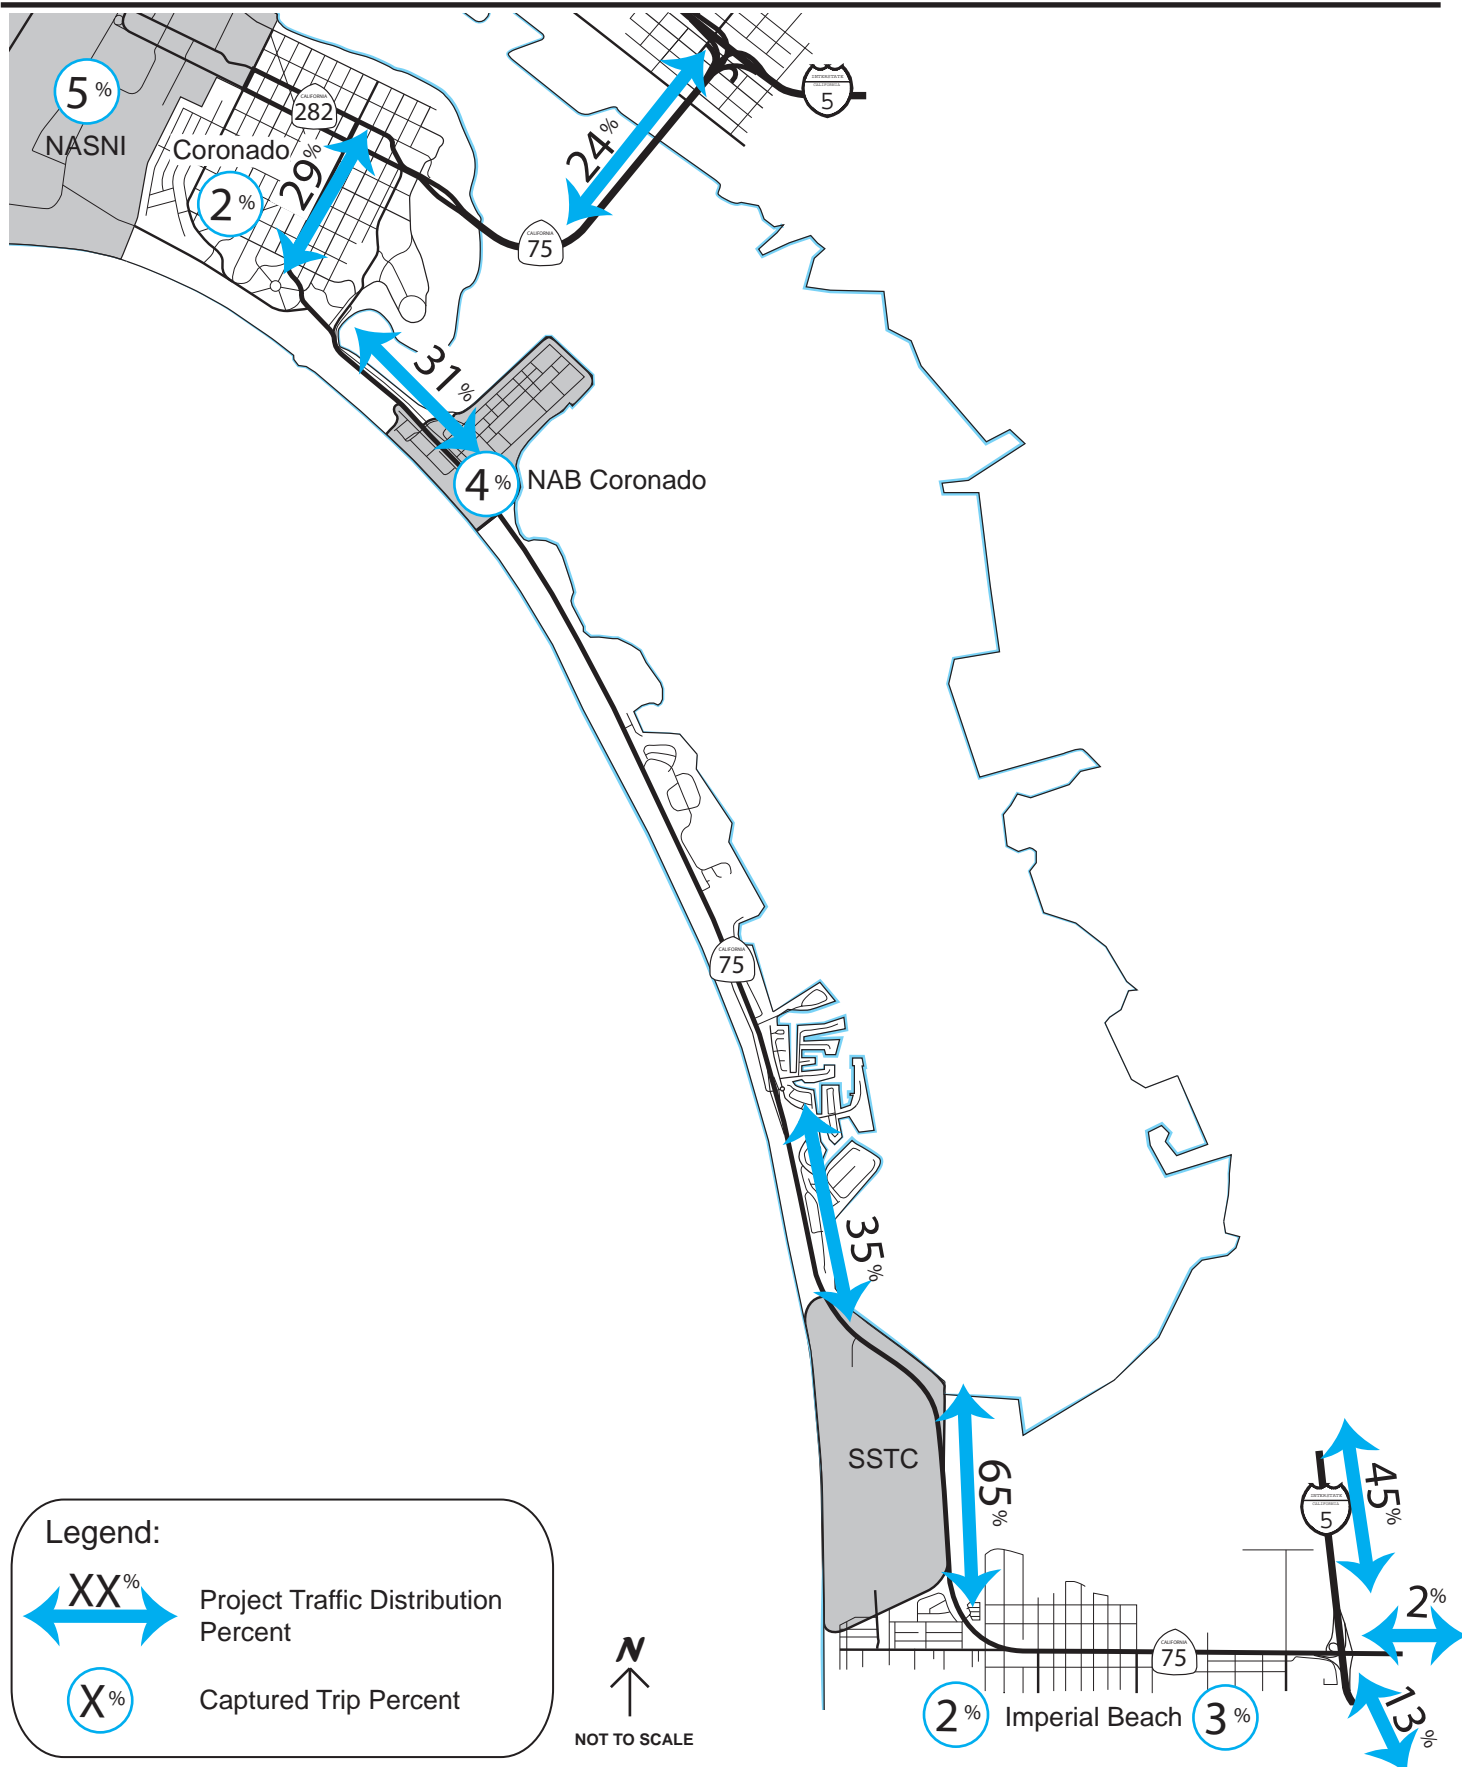

² Daily trips are assumed to be 2.5 trips per person. This rate is obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002, and is consistent with the City of San Diego Land Development Code – Trip Generation Manual, May 2003.

³ Peak hour trip rates are obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002.

⁴ This value is the difference between the calculated number of daily trips by existing personnel and the number of daily trips assumed in the SANDAG Series 12 Forecast Model to access SSTC-South during Year 2008.

⁵ Daily trips obtained from the SANDAG Series 12 Forecast Model, Year 2008, traffic analysis zone (TAZ) 4288.

Alternative 2

As previously established, the differences between Alternatives 1 and 2 are in the layout of buildings internal to SSTC-South and do not affect the personnel changes. Therefore, the external roadway network and traffic volumes for Alternative 2 are assumed to be identical to Alternative 1.

Alternative 3

Road Network

The same roadway network improvements associated with Alternative 1 will be applied to Alternative 3 conditions. These improvements consist of expanding and signalizing the SSTC-South entrance located at the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same as the No Action Alternative with the addition of Alternative 3.

Traffic Volumes

Alternative 3 assumes that proposed NSW facilities will be spread across three locations: the expanded SSTC-South training site, NASNI, and NAB Coronado. Trip generation and distribution was determined for each of these installations as the proposed project will affect all three locations.

It is anticipated that 2,507 personnel will relocate from NAB Coronado to SSTC with the construction of the project. The new vacancy within NAB Coronado will allow an increase of 1,000 personnel from outside sources. Also, the Naval Base Coronado Planning Department is expecting personnel fluctuations independent of the project that must be captured in the NAB Coronado trip generation (549 increase and 123 decrease). Further, it is expected that 191 personnel from locations outside of NAB Coronado will use the facilities at SSTC-South during the peak hours. It is anticipated that 50 personnel are anticipated to relocate to NASNI with the addition of this project. The change in personnel associated with Alternative 3 is summarized in **Table 4-3**.

The project's trip generation was determined based on the change in personnel. It was determined that 2,703 daily trips would be removed from NAB Coronado with the addition of Alternative 3; 243 trips (219 in, 24 out) would be removed from the morning peak hour; and 270 trips (54 in, 216 out) would be removed from the afternoon peak hour. Further, it was determined that 6,745 daily project trips would be added to SSTC-South; 607 trips (546 in, 61 out) would be added during the morning peak hour; and 675 trips (135 in, 540 out) would be added during the afternoon peak hour. Furthermore, it was estimated that 125 daily project trips would be added to NASNI; 11 trips (10 in, 1 out) would be added during the morning peak hour; and 13 trips (3 in, 10 out) would be added during the afternoon peak hour. **Table 4-4** displays the trip generation for Alternative 3 for the NAB Coronado, SSTC-South, and NASNI locations.

Table 4-3. Alternative 3 Personnel Changes

<i>NAB Coronado</i>	<i>+ / -</i>	<i>Number</i>
Existing Total Personnel at NAB (2012) ¹		5,182
<i>Planned increase in personnel by Year 2024</i> ²	(+)	549
Future Total Baseline Personnel at NAB (2024)		5,731
<i>Personnel from NAB relocating to SSTC-South with project</i> ³	(-)	2,507
<i>Personnel relocating elsewhere by Year 2024</i> ²	(-)	123
<i>Increase in personnel with area abandoned by project's personnel relocation</i> ⁴	(+)	1,000
Total Net Personnel at NAB (with project)		4,101
<i>Change in personnel at NAB Coronado with project build out</i>		<i>-1,081</i>

<i>SSTC-South</i>		<i>Number</i>
Existing NSW personnel at SSTC-South ¹		117
<i>NSW personnel to relocate to SSTC-South with project</i> ³	(+)	2,507
<i>Other personnel to use project training facilities</i> ⁵	(+)	191
Total personnel at SSTC-South with project ³		2,815
<i>Change in personnel at SSTC-South with project build out</i>		<i>2,698</i>

<i>NASNI</i>		<i>Number</i>
Existing NSW personnel at NASNI ⁶		30
<i>NSW personnel to relocate to NASNI with project</i> ³	(+)	50
Total NSW personnel at NASNI with project ³		80
<i>Change in personnel at NASNI with project build out</i>		<i>50</i>

Notes:

¹ Existing personnel numbers at NAB Coronado obtained from the Naval Base Coronado Pre-final Activity Overview Plan, dated September 2010.

² This estimate was provided by a Naval Special Warfare representative in January 2012 and based on information known at that time.

³ This value was obtained from a point paper established in February 2013 that reflected anticipated personnel changes with the build out of the NBC Coastal Campus.

⁴ This estimate was provided by a Naval Base Coronado representative and based on an analysis of the potential building space at NAB Coronado vacated by the project.

⁵ This value represents the use of training facilities that would be developed as part of the Coastal Campus project by users not part of Naval Special Warfare. This value was calculated by subtracting the existing and future Naval Special Warfare personnel from the total population anticipated at SSTC-South (3,353-117-3,045 = 191).

⁶ This estimate was provided by a Naval Special Warfare representative in May 2013 and based on information known at that time.

Table 4-4. Alternative 3 Trip Generation Calculations

<i>NAB Coronado</i>	<i>Number</i>
<i>Existing NSW personnel at NAB ¹</i>	<i>5,182</i>
Current daily vehicle trips generated for NAB (2.5 trips / person) ²	12,955
<i>Change in personnel at NAB with project build out</i>	<i>-1,081</i>
Daily vehicle project trips generated for NAB (2.5 trips / person) ²	-2,703
<i>Morning peak hour project trips for NAB ³</i>	<i>-243</i>
<i>Inbound / Outbound</i>	<i>(-219 in / -24 out)</i>
<i>Afternoon peak hour project trips for NAB ³</i>	<i>-270</i>
<i>Inbound / Outbound</i>	<i>(-54 in / -216 out)</i>
Resulting daily vehicle trips for NAB Coronado	10,253

<i>SSTC-South</i>	<i>Number</i>
<i>Existing NSW personnel at SSTC-South ¹</i>	<i>117</i>
Daily vehicle trips generated for SSTC-South (2.5 trips / person) ²	293
Existing daily trips between SSTC-South and NAB Coronado (non-peak) ⁴	504
Current total daily vehicle trips for SSTC-South ⁵	796
<i>Change in personnel at SSTC-South with project build out</i>	<i>2,698</i>
Daily vehicle project trips generated for SSTC-South (2.5 trips / person) ²	6,745
<i>Morning peak hour project trips for SSTC-South ³</i>	<i>607</i>
<i>Inbound / Outbound</i>	<i>(546 in / 61 out)</i>
<i>Afternoon peak hour project trips for SSTC-South ³</i>	<i>675</i>
<i>Inbound / Outbound</i>	<i>(135 in / 540 out)</i>
Resulting daily vehicle trips for SSTC-South	7,541

Notes:

¹ Existing personnel numbers at NAB Coronado obtained from the Naval Base Coronado Pre-final Activity Overview Plan, dated September 2010.

² Daily trips are assumed to be 2.5 trips per person. This rate is obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002, and is consistent with the City of San Diego Land Development Code - Trip Generation Manual, May 2003.

³ Peak hour trip rates are obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002.

⁴ This value is the difference between the calculated number of daily trips by existing personnel and the number of daily trips assumed in the SANDAG Series 12 Forecast Model to access SSTC-South during Year 2008.

⁵ Daily trips obtained from the SANDAG Series 12 Forecast Model, Year 2008, traffic analysis zone (TAZ) 4288.

Table 4-4. Alternative 3 Trip Generation Calculations (cont.)

<i>NASNI</i>	<i>Number</i>
<i>Existing NSW personnel at NASNI</i> ¹	30
Current daily NSW vehicle trips generated for NASNI (2.5 trips / person) ²	75
<i>Change in personnel at NASNI with project build out</i>	50
Daily vehicle project trips generated for NASNI (2.5 trips / person) ²	125
Morning peak hour project trips for NASNI ³	11
<i>Inbound / Outbound</i>	<i>(10 in / 1 out)</i>
Afternoon peak hour project trips for NASNI ³	13
<i>Inbound / Outbound</i>	<i>(3 in / 10 out)</i>

Notes:

¹ Existing personnel numbers at NAB Coronado obtained from the Naval Base Coronado Pre-final Activity Overview Plan, dated September 2010.

² Daily trips are assumed to be 2.5 trips per person. This rate is obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002, and is consistent with the City of San Diego Land Development Code - Trip Generation Manual, May 2003.

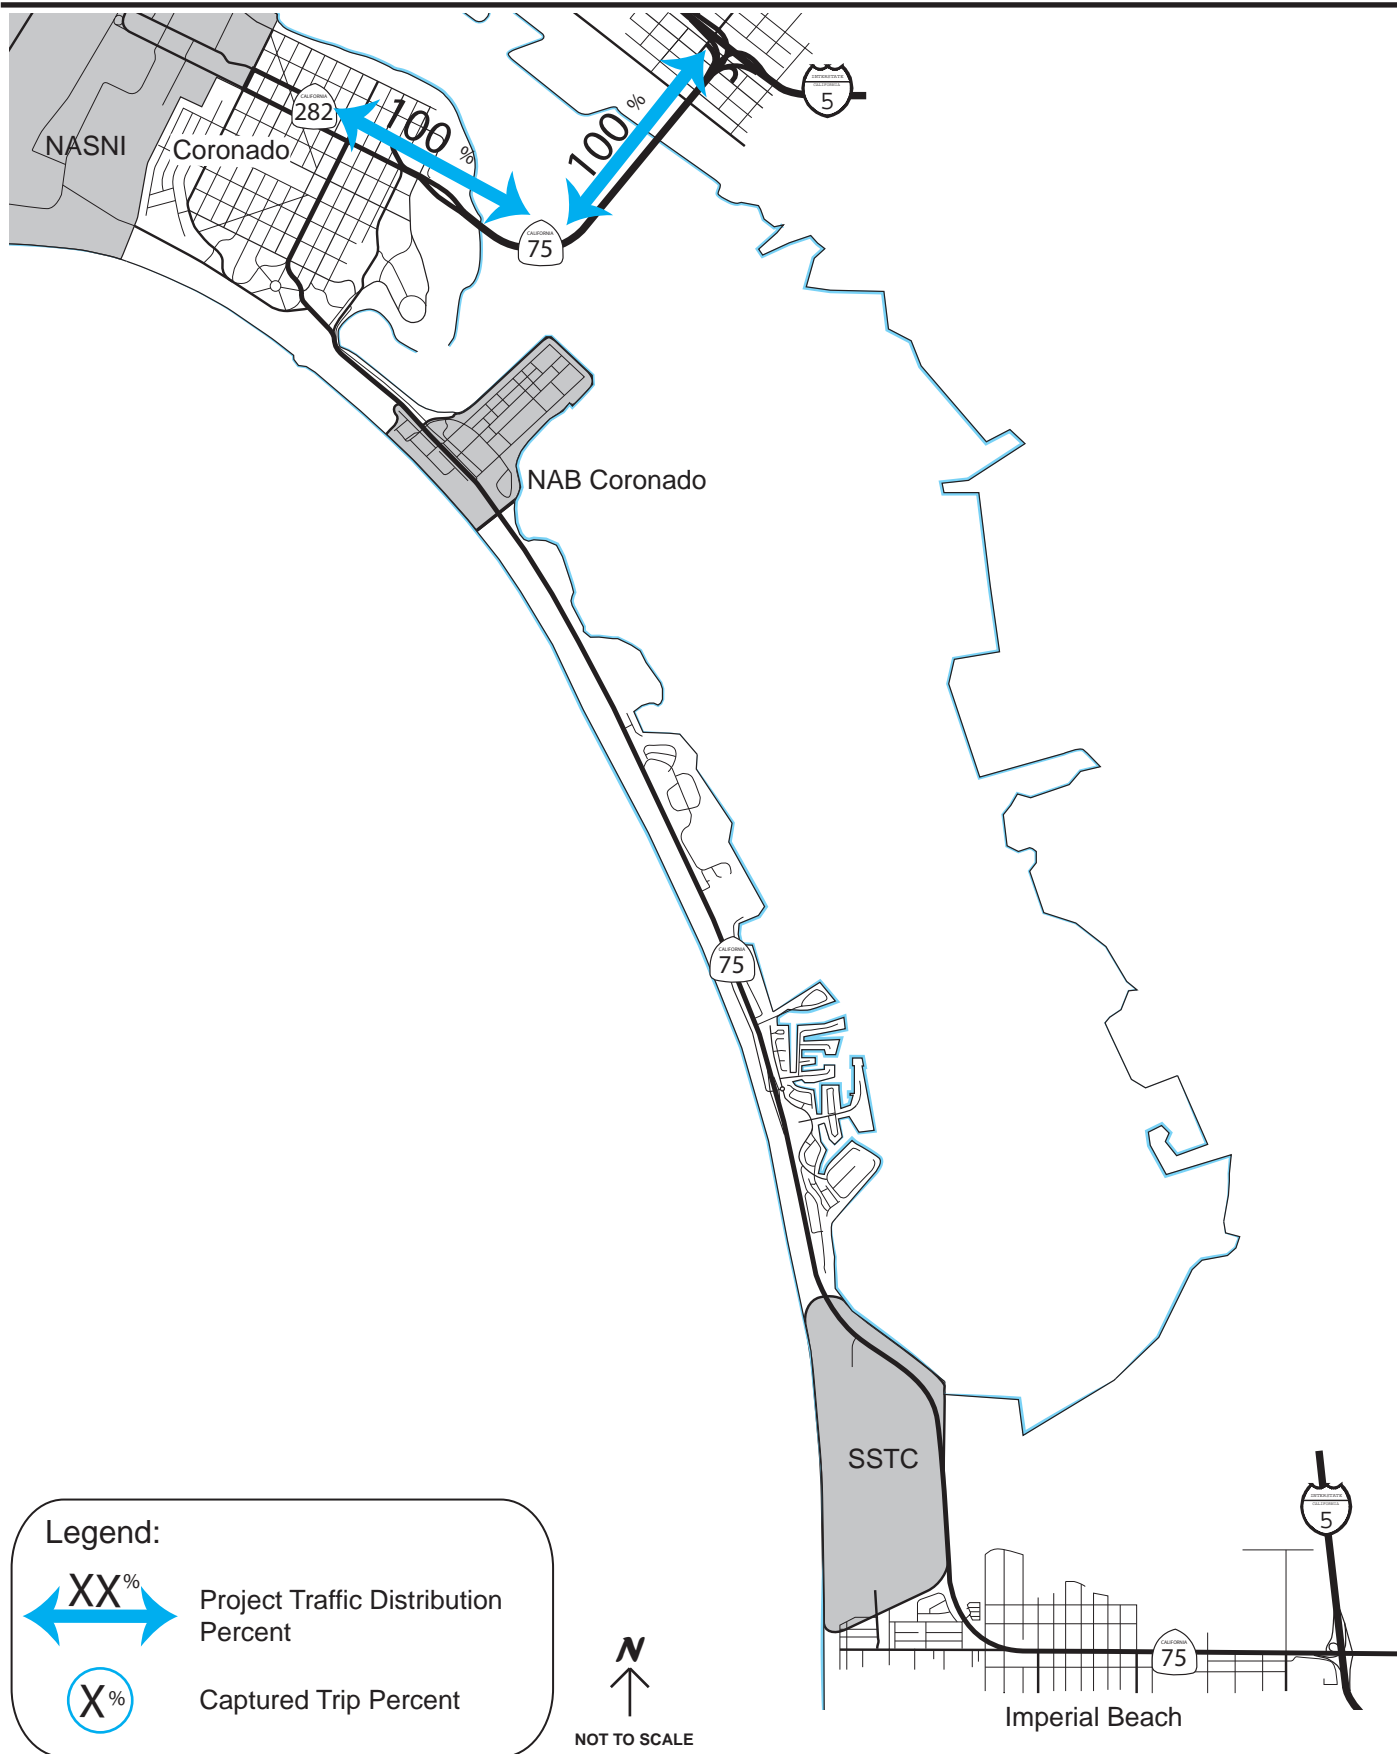

³ Peak hour trip rates are obtained from the Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, SANDAG, April 2002.

⁴ This value is the difference between the calculated number of daily trips by existing personnel and the number of daily trips assumed in the SANDAG Series 12 Forecast Model to access SSTC-South during Year 2008.

⁵ Daily trips obtained from the SANDAG Series 12 Forecast Model, Year 2008, traffic analysis zone (TAZ) 4288.

Alternative 3 trip distribution for NAB Coronado and SSTC-South is the same as Alternative 1 and are shown in Figures 4-1 and 4-2, respectively. It was assumed that all trips going to and from NASNI would travel along SR-75 east of the site. **Figure 4-8** shows the general trip distribution for NASNI. **Figure 4-9** shows the NASNI distribution at each study intersection.

The project's trip generation for each installation was combined with the distributions to determine the project trip assignment at each of the study intersections. **Figure 4-10** shows the Alternative 3 project trips associated with NAB Coronado. The trips are negative because they represent the amount of traffic that will be removed from NAB Coronado in accordance with the personnel fluctuations previously explained. **Figure 4-11** and **Figure 4-12** shows the Alternative 3 project trips for SSTC-South and NASNI, respectively. These trips are positive because they represent the increase in personnel at SSTC-South and NASNI. The NAB Coronado, SSTC-South, and NASNI Alternative 3 individual project trip assignments were added together to get the total Alternative 3 project trips, shown in **Figure 4-13**.

Evaluation without a New Entry Control Point (P947)

P947 is one of the multiple construction projects included in the Proposed Action. This project would construct a new Entry Control Point (ECP) located along Silver Strand Boulevard (SR-75) that would serve as the main access to SSTC-South. The implementation of P947 would provide traffic relief from the local streets within Imperial Beach by shifting access to SSTC-South onto SR-75. As part of the Proposed Action, it is assumed that P947 is in place and that traffic is able to utilize the new ECP. Without P947, the main access to SSTC-South would remain at its current location in Imperial Beach and traffic patterns would be different than what is assumed for the Proposed Action. Although P947 is part of the Proposed Action, the timing of the improvement within the ten-year development period is based on funding availability and is not guaranteed. To determine traffic impacts if P947 is not constructed until the end of the ten-year development period or not implemented at all, scenarios without P947 were included in the analyses.

P947 is a facility that would not generate trips upon completion, therefore the trip generation volumes for each the alternatives would still be accurate. However, without the new ECP along SR-75, traffic distribution would be different for SSTC-South as vehicles would use the existing access in Imperial Beach. **Figure 4-14** illustrates the general trip distribution for SSTC-South without P947 in operation and **Figure 4-15** shows the distribution at each study intersection. **Figures 4-16** and **4-17** provide the resulting SSTC-South and combined trip assignment for Alternative 1, respectively. **Figures 4-18** and **4-19** provide the resulting SSTC-South and combined trip assignment for Alternative 3, respectively.

5.0 YEAR 2024 CONDITIONS

Year 2024 is the year at which all proposed project construction is assumed to be completed and the new facilities are fully operational. A Year 2024 No Action Alternative was established to set baseline conditions. Year 2024 with the three Proposed Action alternatives were then compared to the No-Action Alternative to determine the Proposed Action's impact on the study area. As previously established, Alternatives 1 and 2 are identical from a traffic generation and features standpoint and therefore have identical results. Scenarios with one and two CVNs in port are included in the analysis. Additionally, scenarios with three CVNs in port were not analyzed since required staggering of work hours would result in peak hour traffic volumes that are less than the two CVN scenarios.

Conditions with 1 Carrier Vessel Nuclear (CVN)

Table 5-1 displays the LOS analysis results for the study intersections under Year 2024 with 1 CVN Conditions. **Table 5-2** displays the ILV analysis results for the Palm Avenue and I-5 interchange under the Year 2024 with 1 CVN Conditions. **Appendix G** contains the LOS calculation worksheets and **Appendix H** contains the ILV calculation worksheets. The results of the analyses are summarized below.

No-Action Conditions

Road Network

All intersections and roadway segments in the study area would remain the same as Existing Conditions.

Traffic Volumes

To determine Year 2024 traffic volumes with one CVN in port, linear interpolation was used as described in Chapter 2. To ensure that reasonably foreseeable projects in the area are included in the Year 2024 traffic volumes, traffic from projects in the area that are considered to be approved but not yet completed or occupied was added to existing intersection turning movements volumes and compared to the forecasted Year 2024 volumes. The higher of the two values were used in baseline conditions.

The Hotel Del Coronado expansion was one of two projects identified and added to the baseline volumes as a cumulative project. The Hotel Del Coronado expansion is a 144-room hotel expansion that is anticipated to generate 1,176 daily trips with 81 (49 in, 32 out) am peak-hour trips and 85 (45 in, 40 out) pm peak-hour trips. The other cumulative project identified is a housing development in Imperial Beach north of SR-75 by Rainbow Drive. The project's trip assignment was obtained from its traffic study and applied to the applicable intersections. **Appendix I** contains cumulative project information. **Figure 5-1** shows the Year 2024 No-Action Alternative volumes with one CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM Peak (LOS E)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>PM peak (LOS E)</i> |
| ▪ #9 Strand Way and Guadalcanal Road | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>PM peak (LOS F)</i> |

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Plus Project Conditions

Alternatives 1 and 2

Alternative 1 would have the same external improvements and reallocation of personnel as Alternative 2. Therefore, the analysis for Alternative 2 would be identical to the findings for Alternative 1.

Road Network

The only roadway network change associated with Alternative 1 is implementation of P947, which would install a new entry control point at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 1.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 was added to the No-Action Alternative volumes. **Figure 5-2** shows the resulting Year 2024 Alternative 1 Conditions volumes with 1 CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|---|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, five (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

In general, the intersections in Coronado and at NAB Coronado have a decrease in delay with the addition of Alternative 1 and the intersections in Imperial Beach have an increase in delay. This is a result of a shift in destination from NAB Coronado to SSTC-South for the personnel that would utilize the Proposed Action.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, five study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips with one CVN in port. The proposed mitigation measures that would improve intersection operations to be equal to or better than No-Action Alternative conditions are described below. **Table 5-3** shows the intersection delay and LOS with the proposed mitigation measures in place.

M1. Intersection #10, Silver Strand Boulevard (SR-75) & Tulagi Road

The significant impact at this intersection during the PM peak-hour can be mitigated by modifying the traffic signal timing by extending the green time on Silver Strand Boulevard (SR-75) by ten seconds to reflect a different traffic pattern that would be in place with the addition of the Proposed Action. The traffic signal is uncoordinated and the cycle length would be adjusted to include this additional ten seconds. No changes to the existing right-of-way and pavement width would be required.

M2. Intersection #18, Silver Strand Boulevard (SR-75) & Rainbow Drive

The significant impact at this intersection during the AM peak-hour can be mitigated by modifying the lane configuration on the eastbound Rainbow Drive approach. Changing the existing through-right lane into a left-through-right lane and extending the existing turn pocket to the intersection of Bonito Avenue increases capacity and queue area for this approach. The extension of the turn pocket would result in a loss of two 2-hour limit parking spaces. No changes to the existing right-of-way and pavement width would be required. This improvement is illustrated in **Figure 5-3**.

M3. Intersection #26, 9th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by restriping the northbound and southbound approaches to have exclusive left-turn lanes and a shared through-right lane. The signal operations could then be changed from split phasing to protected left-turn phasing for these approaches. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By changing the phasing, it allows the northbound and southbound through movements and pedestrian crossings to occur simultaneously, ultimately reducing the amount of time needed for 9th Street and providing more green time for Palm Avenue (SR-75). This improvement is illustrated in **Figure 5-4**.

M4. Intersection #28, 13th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by removing the pedestrian crossing on the east leg of the intersection and shortening the corresponding northbound split time. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By providing just a single crosswalk, it allows more green time to be assigned to the heavy movements on Palm Avenue (SR-75). This improvement is illustrated in **Figure 5-5**.

M5. Intersection #30, Saturn Boulevard/19th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated with the addition of a second westbound left-turn lane. There is currently a single westbound left-turn lane adjacent to an eight-foot wide raised median. To fit in a second left-turn lane within the existing curb width, the median would need to be reduced to four-feet wide and the eastbound through lane widths would need to be narrowed slightly. The bike lane would operate similar to its current layout. This improvement is illustrated in **Figure 5-6**. Although the improvement does not improve intersection operations to LOS D or better, it restores operations to an average delay better than the No-Action Alternative and therefore mitigates the significant project impact.

Table 5-3. Year 2024 with 1 CVN Alternative 1 Intersection Mitigation Summary

INTERSECTION		PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.6 (A)	78.1 (E)	3.6 (A)	49.6 (D)
18	Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	141.6 (F)	47.2 (D)	53.7 (D)	28.9 (C)
26	9 th St & Palm Ave (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	49.8 (D)	58.8 (E)	43.0 (D)	49.5 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	40.2 (D)	59.4 (E)	39.6 (D)	53.6 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	61.1 (E)	215.7 (F)	53.1 (D)	106.4 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

The only roadway network change associated with Alternative 3 is implementation of P947, the new ECP at SSTC-South and new signal at the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 3.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 was added to the No-Action Alternative volumes. **Figure 5-7** shows the resulting Year 2024 Alternative 3 Conditions volumes with 1 CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|---|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, five (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. These are the same five locations that would have an impact for Alternative 1.

In general, the intersections in Coronado are similar to the No-Action Alternative, intersections at NAB Coronado have a decrease in delay, and intersections in Imperial Beach have an increase in delay with the addition of Alternative 3. This is primarily a result of a shift in destination from NAB Coronado to SSTC-South for some personnel that currently go to NAB Coronado.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, five study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips. The proposed mitigation measures that would allow the intersections to operate at or better than the No Action Alternative conditions for Alternative 3 are the same that were previously described for Alternative 1. A summary of the mitigation and the operation analysis results with the mitigations in place are shown in **Table 5-4**.

Table 5-4. Year 2024 with 1 CVN Alternative 3 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.5 (A)	76.6 (E)	3.5 (A)	48.5 (D)
18 Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	132.5 (F)	41.8 (D)	51.7 (D)	28.0 (C)
26 9 th St & Palm Ave (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	47.0 (D)	56.3 (E)	41.8 (D)	48.6 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	39.6 (D)	56.7 (E)	39.2 (D)	52.4 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	58.9 (E)	210.0 (F)	48.8 (D)	102.6 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Plus Project without P947 Conditions

P947 is one of the multiple construction projects included in the Proposed Action and would construct a new ECP at SSTC-South located along Silver Strand Boulevard (SR-75). The implementation of P947 provides traffic relief from the local streets within Imperial Beach by shifting access to SSTC-South onto SR-75. This scenario was analyzed to determine traffic impacts if P947 is not constructed until the end of the ten-year development period, or not implemented at all. The results of the analyses are summarized below.

Alternatives 1 and 2

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 1 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 without P947 was added to the No-Action Alternative volumes. **Figure 5-8** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #21 Silver Strand Boulevard and Palm Avenue | <i>PM peak (LOS F)</i> |
| ▪ #22 3rd Street and Palm Avenue | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>AM & PM peaks (LOS E/E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

The addition of Alternative 1 traffic without P947 would result in impacts at three locations on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips without P947. At the following four locations the mitigation measures identified for Alternative 1 with inclusion of P947 would still apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

The proposed mitigation measures that would improve intersection operations to be equal to or better than No-Action Alternative conditions for the other five intersections are described below. **Table 5-5** summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

M6. Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)

The significant impact at this intersection could be mitigated by striping the southbound approach to include a left-turn pocket and through-right lane. This would require removing some parking along 7th Street to make room for the additional lane, estimated to be two parking spaces. This improvement is illustrated in **Figure 5-9**.

M7. Intersection #21, Silver Strand Boulevard and Palm Avenue

The significant impact at this intersection would require widening of Silver Strand Boulevard from two lanes to four lanes and installation of a traffic signal at the intersection. Even with these improvements the intersection would still operate at LOS E during the PM peak hour. The amount of traffic anticipated by the Proposed Action cannot be accommodated by the existing street network in Imperial Beach along Silver Strand Boulevard and Palm Avenue between Silver Strand Boulevard and SR-75. This area is primarily residential with schools and small retail and is designed to accommodate pedestrians and bicyclists. The City of Imperial Beach recently completed improvements on Palm Avenue to slow down traffic to improve bicycle and pedestrian mobility. The amount of vehicles generated by the Proposed Action combined with security procedures necessary at the entry control point along Silver Strand Boulevard would congest the streets beyond their capacity and make the area unwelcoming for pedestrians and bicyclists. A signal warrant analysis for this intersection is provided in **Appendix J**.

M8. Intersection #22, 3rd Street and Palm Avenue

The significant impact at this intersection during the AM and PM peak-hours can be mitigated with the installation of a traffic signal. A signal warrant analysis for this intersection is provided in **Appendix J**.

M9. Intersection #23, Palm Avenue and Rainbow Drive

The significant impact at this intersection during the AM and PM peak-hours can be mitigated by restricting southbound left-turn movements. Vehicles that want to head eastbound on Palm Avenue from Rainbow Drive could utilize the intersection of Rainbow Drive and Silver Strand Boulevard (SR-75), approximately 700 feet north of this intersection to head eastbound. By removing the southbound left-turn movement, the number of conflict points at the intersection is reduced and the intersection operation is simplified.

Table 5-5. Year 2024 with 1 CVN Alternative 1 without P947 Intersection Mitigation Summary

	INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.6 (A)	76.1 (E)	3.6 (A)	47.9 (D)
19	7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	117.2 (F)	67.7 (E)	47.6 (D)	46.6 (D)
21	Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	30.5 (D)	>1000 (F)	6.9 (A)	25.8 (C)
22	3 rd St & Palm Ave	Install a traffic signal	167.6 (F)	385.0 (F)	9.0 (A)	21.0 (C)
23	Palm Ave & Rainbow Dr	Restrict SB left-turn movement	392.4 (F)	669.1 (F)	12.1 (B)	14.8 (B)
26	9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	55.5 (E)	63.8 (E)	45.1 (D)	50.4 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	41.2 (D)	64.0 (E)	40.4 (D)	55.0 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	65.6 (E)	224.6 (F)	52.0 (D)	112.6 (F)
31	I-5 SB Exit Ramps & Palm Ave (SR-75)	Change signal timings	47.6 (D)	55.3 (E)	47.6 (D)	54.5 (D)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

M10. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by adjusting the signal timing at the intersection. The length of the eastbound, westbound, and southbound signal splits would need to be increased by 5 seconds (for a total cycle increase of 10 seconds).

Alternative 3

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 3 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 without P947 was added to the No-Action Alternative volumes. **Figure 5-10** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #21 Silver Strand Boulevard and Palm Avenue | <i>PM peak (LOS F)</i> |
| ▪ #22 3rd Street and Palm Avenue | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, eight (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

The addition of Alternative 3 traffic without P947 would result in impacts at three locations on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, eight study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips without P947. At the following four locations the mitigation measures identified for Alternative 3 with inclusion of P947 would still apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

The additional four intersections that would have impacts without P947 would require mitigations similar to those identified for Alternative 1 without P947:

- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive

Table 5-6 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 5-6. Year 2024 with 1 CVN Alternative 3 without P947 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10	Silver Strand Blvd (SR-75) & Tulagi Rd	3.6 (A)	74.8 (E)	3.6 (A)	47.0 (D)
19	7 th St & Silver Strand Blvd (SR-75)	116.4 (F)	67.3 (E)	48.4 (D)	47.7 (D)
21	Silver Strand Blvd & Palm Ave	24.7 (C)	854.1 (F)	6.6 (A)	19.0 (B)
22	3 rd St & Palm Ave	113.6 (F)	303.7 (F)	8.4 (A)	14.1 (B)
23	Palm Ave & Rainbow Dr	244.1 (F)	424.7 (F)	12.0 (B)	12.2 (B)
26	9 th St & Silver Strand Blvd (SR-75)	50.6 (D)	59.7 (E)	43.2 (D)	49.1 (D)
28	13 th St & Palm Ave (SR-75)	40.3 (D)	60.1 (E)	39.8 (D)	53.2 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	61.9 (E)	217.1 (F)	50.0 (D)	107.4 (F)

Note: Table reflects intersection Delay (LOS). Although the mitigation does not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Conditions with 2 Carrier Vessels Nuclear (CVN)

Table 5-7 displays the LOS analysis results for the study intersections under Year 2024 with 2 CVNs Conditions. **Table 5-8** displays the ILV analysis results for the Palm Avenue and I-5 interchange under the Year 2024 with 2 CVNs Conditions. **Appendix G** contains the LOS calculation worksheets and **Appendix H** contains the ILV calculation worksheets. The results of the analyses are summarized below.

No-Action Conditions

Traffic Volumes

Year 2024 1 CVN volumes were adjusted using forecast methodology contained in **Appendix C** to determine the Year 2024 volume when two and three CVNs are in port. **Figure 5-11** shows the Year 2024 No Action Alternative volumes with two CVNs in port. When there are three CVNs in port, staggered work hours are required, so three CVNs results in lower peak-hour volumes than two CVNs and are not included in the analysis. However, the volumes with three CVNs in port are provided in **Appendix E**.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM Peak (LOS F)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>PM peak (LOS E)</i> |
| ▪ #9 Strand Way and Guadalcanal Road | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS F)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>PM peak (LOS F)</i> |

No additional intersections would operate at unacceptable operations with the second CVN.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Table 5-7. Year 2024 with 2 CVNs Intersection Analysis Summary

Notes: P947 is a MILCON project that would construct a new ECP at SSTC-South along SR-75.

*Delay shown represents a signalized intersection and P947 improvements; the existing unsignalized intersection configuration would operate at LOS F. ** Intersection does not exist under this scenario

Table reflects intersection Delay (LOS). **Bold** indicates intersections operating at an unacceptable LOS E or F. **Bold and shaded** cells indicate locations where the project has an impact.

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

NOT TO SCALE

Plus Project Conditions

Alternatives 1 and 2

Alternative 1 would have the same external improvements and reallocation of personnel as Alternative 2. Therefore, the analysis for Alternative 1 would be identical to the findings for Alternative 2.

Road Network

The only roadway network change associated with Alternative 1 is implementation of P947, which would install a new ECP at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 1.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 was added to the No-Action Alternative volumes. **Figure 5-12** shows the Year 2024 Alternative 1 Conditions volumes with 2 CVNs in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS F)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, six (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. Five of these six locations would have impacts with one CVN in port. The intersection of 7th Street and Silver Strand Boulevard (SR-75) would be an additional impact for Alternative 1 when two CVNs are in port.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Mitigation

As mentioned, six study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips with two CVNs in port. The following mitigation measures presented with one CVN in port would allow the intersections to operate at or better than the No Action with two CVNs in port:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

The mitigation measure previously presented for the intersection of 7th Street and Silver Strand Boulevard (SR-75) would also apply to this scenario:

- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)

Table 5-9 summarizes the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 5-9. Year 2024 with 2 CVNs Alternative 1 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.6 (A)	84.6 (F)	3.6 (A)	38.1 (D)
18 Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	148.7 (F)	52.2 (D)	58.7 (E)	32.4 (C)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	113.3 (F)	69.8 (E)	59.6 (E)	54.9 (D)
26 9 th St & Palm Ave (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	52.8 (D)	61.4 (E)	44.2 (D)	50.4 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	40.7 (D)	61.7 (E)	39.9 (D)	54.6 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	63.6 (E)	220.4 (F)	50.9 (D)	109.6 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

The only roadway network change associated with Alternative 3 is implementation of P947, which would install a new ECP at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 3.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 was added to the No-Action Alternative volumes. **Figure 5-13** shows the Year 2024 Alternative 3 Conditions volumes with 2 CVNs in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, six (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. Five of the six locations are the same intersections that would have impacts with one CVN in port. The intersection of Orange Avenue (SR-75) and Fourth Street (SR-75) was found to be an additional impact when two CVNs are in port.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Mitigation

As mentioned, six study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips with two CVNs in port. The proposed mitigation measures that would allow the intersections to operate at or better than the No-Action are the same that were previously described for Alternative 3 with one CVN in port:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

NOT TO SCALE

The intersection of Orange Avenue (SR-75) and Fourth Street (SR-75) is considered an impact because it worsens an existing LOS F condition by more than 1 second. The increase in delay for the Alternative 3 scenario when two CVNs are in port is 1.1 seconds. There was no reasonable mitigation found for this location. It would be considered a significant and unavoidable impact.

Table 5-1 summarizes the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 5-10. Year 2024 with 2 CVNs Alternative 3 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
4	Orange Ave (SR-75) & Fourth St (SR-75)	38.3 (D)	107.2 (F)	38.3 (D)	107.2 (F)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	3.6 (A)	83.0 (F)	3.6 (A)	37.5 (D)
18	Silver Strand Blvd (SR-75) & Rainbow Dr	139.4 (F)	46.1 (D)	54.2 (D)	28.8 (C)
26	9 th St & Palm Ave (SR-75)	49.2 (D)	58.3 (E)	42.7 (D)	49.3 (D)
28	13 th St & Palm Ave (SR-75)	40.0 (D)	58.8 (E)	39.4 (D)	53.2 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	60.9 (E)	214.4 (F)	49.6 (D)	105.7(F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Plus Project without P947 Conditions

As previously mentioned, the implementation of P947 provides traffic relief from the local streets within Imperial Beach by shifting access to SSTC-South onto SR-75. This scenario was analyzed to determine traffic impacts if P947 is not constructed until the end of the ten-year development period, or not implemented at all.

Alternatives 1 and 2

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 1 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 without P947 was added to the No-Action Alternative volumes. **Figure 5-14** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #21 Silver Strand Boulevard and Palm Avenue | <i>PM peak (LOS F)</i> |
| ▪ #22 3rd Street and Palm Avenue | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>AM & PM peaks (LOS E/E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. All nine of the impacts were also impacts with one CVN in port.

The addition of Alternative 1 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips without P947. The following mitigation measures identified for Alternative 1 with inclusion of P947 would still apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

The other five intersections that would have impacts without P947 when two CVNs are in port would require mitigations similar to when one CVN is in port:

- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive
- [M10] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

Table 5-11 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 5-11. Year 2024 with 2 CVNs Alternative 1 without P947 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.6 (A)	82.7 (F)	3.6 (A)	52.7 (D)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	116.0 (F)	67.2 (E)	48.6 (D)	47.7 (D)
21 Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	30.5 (D)	>1000 (F)	6.9 (A)	25.8 (C)
22 3 rd St & Palm Ave	Install a traffic signal	167.6 (F)	385.0 (F)	9.0 (A)	21.0 (C)
23 Palm Ave & Rainbow Dr	Restrict SB left-turn movement	392.4 (F)	669.1 (F)	12.1 (B)	14.8 (B)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	59.2 (E)	66.8 (E)	46.3 (D)	51.3 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	41.8 (D)	66.9 (E)	40.7 (D)	54.6 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	68.6 (E)	229.4 (F)	54.2 (D)	116.0 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Change signal timings	52.1 (D)	56.4 (E)	52.1 (D)	54.1 (D)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 3 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 without P947 was added to the No-Action Alternative volumes. **Figure 5-15** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #21 Silver Strand Boulevard and Palm Avenue | <i>PM peak (LOS F)</i> |
| ▪ #22 3rd Street and Palm Avenue | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. All nine of the impacts were also impacts with one CVN in port.

The addition of Alternative 3 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips without P947. The following mitigation measures identified for Alternative 3 with inclusion of P947 would still apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

NOT TO SCALE

Four of the other five intersections that would have impacts without P947 when two CVNs are in port would require mitigations similar to when one CVN is in port:

- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive

As previously discussed, no reasonable mitigation was found for the impact at the intersection of Orange Avenue (SR-75) and Fourth Street (SR-75). It would be considered a significant and unavoidable impact.

Table 5-12 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 5-12. Year 2024 with 2 CVNs Alternative 3 without P947 Intersection Mitigation Summary

INTERSECTION		PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
4	Orange Ave (SR-75) & Fourth St (SR-75)	None [significant and unavoidable]	38.0 (D)	107.6 (F)	38.0 (D)	107.6 (F)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.6 (A)	81.4 (F)	3.6 (A)	51.8 (D)
19	7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	115.3 (F)	67.1 (E)	48.9 (D)	48.0 (D)
21	Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	24.7 (C)	854.1 (F)	6.6 (A)	20.0 (B)
22	3 rd St & Palm Ave	Install a traffic signal	113.6 (F)	303.7 (F)	8.4 (A)	15.1 (B)
23	Palm Ave & Rainbow Dr	Restrict SB left-turn movement	244.1 (F)	424.7 (F)	12.0 (B)	14.6 (B)
26	9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	53.8 (D)	62.4 (E)	44.4 (D)	49.9 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	40.8 (D)	62.5 (E)	40.1 (D)	53.5 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	64.4 (E)	221.8 (F)	50.8 (D)	110.7 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

6.0 YEAR 2040 CONDITIONS

Year 2040 is the future year that represents a horizon year condition, approximately 30 years from existing conditions. The Year 2040 roadway network is assumed to be the same as in the Existing Condition and is consistent with adjacent City-adopted community plans. A Year 2040 No-Action Alternative was established to set baseline conditions and then Year 2040 with the project alternatives were compared to determine the Proposed Action's impact on the study area. Similar to the Year 2024 conditions, scenarios with one and two CVNs in port are included in the analysis. Scenarios with three CVNs in port were not analyzed since required staggering of work hours would result in peak hour traffic volumes that are less than the two CVN scenarios. Further, Alternatives 1 and 2 are identical from a traffic generation standpoint and therefore have identical results.

Conditions with 1 Carrier Vessel Nuclear (CVN)

Table 6-1 displays the LOS analysis results for the study intersections under Year 2040 with 1 CVN Conditions. **Table 6-2** displays the ILV analysis results for the Palm Avenue and I-5 interchange under the Year 2040 with 1 CVN Conditions. **Appendix G** contains the LOS calculation worksheets and **Appendix H** contains the ILV calculation worksheets. The results of the analyses are summarized below.

No-Action Conditions

Road Network

Under the Year 2040 scenario, it is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions.

Traffic Volumes

To generate Year 2040 volumes, a comparison of 2008 and 2040 SANDAG Series 12 Traffic Forecast Models was performed and resulting growth factors were applied to the existing intersection volumes as described in Chapter 2. **Figure 6-1** shows the Year 2040 No-Action Alternative Conditions volumes with one CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except the following:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>AM & PM peaks (LOS E/F)</i> |
| ▪ #9 Strand Way and Guadalcanal Road | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #11 Silver Strand Boulevard (SR-75) and Fiddler's Cove Dwy | <i>AM peak (LOS E)</i> |
| ▪ #12 Silver Strand Boulevard (SR-75) and Leyte Rd | <i>AM peak (LOS E)</i> |
| ▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave | <i>AM peak (LOS E)</i> |
| ▪ #16 Silver Strand Boulevard (SR-75) and Coronado Cays Blvd | <i>AM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Dr | <i>AM peak (LOS F)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Table 6-1. Year 2040 with 1 CVN Intersection Analysis Summary

INTERSECTION		NO ACTION		PLUS PROJECT				PLUS PROJECT (W/O P947)

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

Plus Project Conditions

Alternatives 1 and 2

Alternative 1 would have the same external improvements and reallocation of personnel as Alternative 2. Therefore, the analysis for Alternative 2 would be identical to the findings for Alternative 1.

Road Network

The only roadway network change associated with Alternative 1 is implementation of P947, which would install a new entry control point at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 1.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 was added to the No-Action Alternative volumes. **Figure 6-2** shows the resulting Year 2040 Alternative 1 Conditions volumes with 1 CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS E)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave | <i>AM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Dr | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>AM & PM peaks (LOS F/E)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS F/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, seven (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

In general, the addition of Alternative 1 improved intersection operations in Coronado, at NAB Coronado, and along Silver Strand Boulevard (SR-75) but worsened operations along Palm Avenue (SR-75). This is a result of the shift in personnel from NAB Coronado to SSTC-South.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Figure 6-2c

Mitigation

As mentioned, seven study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips with one CVN in port. Six of the proposed mitigation measures that would allow the intersection to operate at or better than the No-Action Alternative conditions are the same mitigations that have been previously described:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)

For the intersection of Palm Avenue and I-5 Southbound Exit Ramp, the timing adjustment previously described would not provide enough improvement to mitigate the impact.

M11. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact at this intersection can be partially mitigated by extending the southbound right turn storage pockets. This would require widening the exit ramp. No feasible improvement was identified to improve operations to LOS D or better, but providing additional storage space keeps vehicles off of the freeway mainline.

Table 6-3 shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-3. Year 2040 with 1 CVN Alternative 1 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.8 (A)	114.4 (F)	3.8 (A)	42.7 (D)
18 Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	196.7 (F)	80.4 (F)	81.4 (F)	41.4 (D)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	154.8 (F)	85.8 (F)	73.5 (E)	60.1 (E)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	86.5 (F)	73.3 (E)	46.8 (D)	53.4 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	43.9 (D)	76.3 (E)	43.8 (D)	54.0 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	99.8 (F)	254.5 (F)	66.7 (E)	142.1 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	68.1 (E)	85.7 (F)	68.1 (E)	85.7 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

The only roadway network change associated with Alternative 3 is implementation of P947, the new ECP at SSTC-South and new signal at the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 3.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 was added to the No-Action Alternative volumes. **Figure 6-3** shows the resulting Year 2040 Alternative 3 Conditions volumes with 1 CVN in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS E)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS E)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS E)</i>
▪ #9 Strand Way and Guadalcanal Road	<i>PM peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #12 Silver Strand Boulevard (SR-75) and Leyte Road	<i>AM peak (LOS E)</i>
▪ #13 Silver Strand Boulevard (SR-75) and Attu Avenue	<i>AM peak (LOS E)</i>
▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive	<i>AM & PM peaks (LOS F/E)</i>
▪ #19 7th Street and Silver Strand Boulevard (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #23 Palm Avenue and Rainbow Drive	<i>AM peak (LOS E)</i>
▪ #26 9th Street and Palm Avenue (SR-75)	<i>AM & PM peaks (LOS E/E)</i>
▪ #28 13th Street and Palm Avenue (SR-75)	<i>PM peak (LOS E)</i>
▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, seven (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

With the addition of Alternative 3 the intersections in Coronado are similar to No-Action Alternative results, intersections near NAB Coronado and along Silver Strand have a decrease in delay, and intersections along Palm Avenue (SR-75) in Imperial Beach have an increase in delay.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Mitigation

As mentioned, seven study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips. The proposed mitigation measures that would allow the intersections to operate at or better than the No Action Alternative conditions for Alternative 3 are the same that were previously described for Alternative 1:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

A summary of the mitigation and the operation analysis results with the mitigations in place are shown in **Table 6-4**.

Table 6-4. Year 2040 with 1 CVN Alternative 3 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.8 (A)	112.8 (F)	3.8 (A)	42.2 (D)
18 Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	187.0 (F)	72.8 (E)	75.3 (E)	38.2 (D)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	151.4 (F)	84.1 (F)	68.4 (E)	57.9 (E)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	79.8 (E)	69.1 (E)	45.4 (D)	52.1 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	42.8 (D)	71.9 (E)	43.2 (D)	51.7 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	95.8 (F)	248.6 (F)	65.3 (E)	137.1 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	64.5 (E)	84.4 (F)	64.5 (E)	84.4 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Plus Project without P947 Conditions

As previously mentioned, the implementation of P947 provides traffic relief from the local streets within Imperial Beach by shifting access to SSTC-South onto SR-75. This scenario was analyzed to determine traffic impacts if P947 is not constructed until the end of the ten-year development period, or not implemented at all.

Alternatives 1 and 2

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 1 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 without P947 was added to the No-Action Alternative volumes. **Figure 6-4** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS E)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS E)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave	<i>AM peak (LOS E)</i>
▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive	<i>AM peak (LOS F)</i>
▪ #19 7th Street and Silver Strand Boulevard (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #21 Silver Strand Boulevard and Palm Avenue	<i>PM peak (LOS F)</i>
▪ #22 3rd Street and Palm Avenue	<i>AM & PM peaks (LOS F/F)</i>
▪ #23 Palm Avenue and Rainbow Drive	<i>AM & PM peaks (LOS F/F)</i>
▪ #26 9th Street and Palm Avenue (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #28 13th Street and Palm Avenue (SR-75)	<i>PM peak (LOS F)</i>
▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. All nine of the impacts were also impacts under the Year 2024 with 1 CVN Conditions.

The addition of Alternative 1 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips without P947. The following mitigation measures identified previously would apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

Table 6-5 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-5. Year 2040 with 1 CVN Alternative 1 without P947 Intersection Mitigation Summary

INTERSECTION		PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.8 (A)	112.9 (F)	3.8 (A)	78.0 (E)
19	7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	151.9 (F)	82.5 (F)	51.4 (D)	49.7 (D)
21	Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	31.3 (D)	>1000 (F)	7.0 (A)	25.3 (C)
22	3 rd St & Palm Ave	Install a traffic signal	170.6 (F)	390.5 (F)	9.0 (A)	21.8 (C)
23	Palm Ave & Rainbow Dr	Restrict SB left-turn movement	436.0 (F)	722.4 (F)	12.1 (B)	15.1 (C)
26	9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	97.1 (F)	80.6 (F)	51.0 (D)	51.2 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	45.9 (D)	82.9 (F)	44.7 (D)	54.2 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	106.2 (F)	263.7 (F)	75.9 (E)	149.2 (F)
31	I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	75.5 (E)	87.9 (F)	75.5 (E)	87.9 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 3 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 without P947 was added to the No-Action Alternative volumes. **Figure 6-5** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods with, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS E)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS E)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS E)</i>
▪ #9 Strand Way and Guadalcanal Road	<i>PM Peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #12 Silver Strand Boulevard (SR-75) and Leyte Road	<i>AM peak (LOS E)</i>
▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave	<i>AM peak (LOS E)</i>
▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive	<i>AM peak (LOS F)</i>
▪ #19 7th Street and Silver Strand Boulevard (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #21 Silver Strand Boulevard and Palm Avenue	<i>PM peak (LOS F)</i>
▪ #22 3rd Street and Palm Avenue	<i>AM & PM peaks (LOS F/F)</i>
▪ #23 Palm Avenue and Rainbow Drive	<i>AM & PM peaks (LOS F/F)</i>
▪ #26 9th Street and Palm Avenue (SR-75)	<i>AM & PM peaks (LOS F/E)</i>
▪ #28 13th Street and Palm Avenue (SR-75)	<i>PM peak (LOS E)</i>
▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. Eight of the nine impacts were also impacts under the Year 2024 with 1 CVN Conditions, with the intersection of I-5 Southbound Exit Ramp and Palm Avenue (SR-75) being the intersection that was not an impact under that scenario.

The addition of Alternative 3 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

IMPERIAL BEACH

Study intersections 18 - 33

Legend

X / Y = AM / PM PEAK HOUR
TURNING VOLUMES

NOT TO SCALE

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips without P947. The mitigation measures identified for Alternative 1 would also apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

Table 6-6 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-6. Year 2040 with 1 CVN Alternative 3 without P947 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.8 (A)	111.4 (F)	3.8 (A)	76.8 (E)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	150.9 (F)	82.4 (F)	51.9 (D)	50.0 (D)
21 Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	25.2 (D)	879.9 (F)	13.0 (B)	19.3 (B)
22 3 rd St & Palm Ave	Install a traffic signal	116.4 (F)	308.8 (F)	8.5 (A)	14.4 (B)
23 Palm Ave & Rainbow Dr	Restrict SB left-turn movement	274.3 (F)	463.5 (F)	12.0 (B)	14.6 (B)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	88.2 (E)	74.6 (F)	48.2 (D)	50.2 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	44.2 (D)	77.3 (E)	43.8 (D)	51.7 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	100.7 (F)	256.1 (F)	71.8 (E)	143.4 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	69.4 (E)	86.1 (F)	69.4 (E)	86.1 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Conditions with 2 Carrier Vessels Nuclear (CVN)

Table 6-7 displays the LOS analysis results for the study intersections under Year 2024 with 2 CVNs Conditions. **Table 6-8** displays the ILV analysis results for the Palm Avenue and I-5 interchange under the Year 2024 with 2 CVNs Conditions. **Appendix G** contains the LOS calculation worksheets and **Appendix H** contains the ILV calculation worksheets. The results of the analyses are summarized below.

No-Action Conditions

Traffic Volumes

Year 2040 1 CVN volumes were adjusted using forecast methodology contained in **Appendix C** to determine the Year 2040 volume when two and three CVNs are in port. **Figure 6-6** shows the Year 2024 No Action Alternative volumes with two CVNs in port. When there are three CVNs in port, staggered work hours are required, so three CVNs results in lower peak-hour volumes than two CVNs and are not included in the analysis. However, the volumes with three CVNs in port are provided in **Appendix E**.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>AM & PM peaks (LOS E/F)</i> |
| ▪ #9 Strand Way and Guadalcanal Road | <i>PM peak (LOS F)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #11 Silver Strand Boulevard (SR-75) and Fiddler's Cove Dwy | <i>AM peak (LOS E)</i> |
| ▪ #12 Silver Strand Boulevard (SR-75) and Leyte Rd | <i>AM peak (LOS E)</i> |
| ▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave | <i>AM peak (LOS E)</i> |
| ▪ #16 Silver Strand Boulevard (SR-75) and Coronado Cays Blvd | <i>AM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Dr | <i>AM peak (LOS E)</i> |
| ▪ #19 7 th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM peak (LOS E)</i> |
| ▪ #28 13 th Street and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS E/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>PM peak (LOS E)</i> |

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Table 6-7. Year 2040 with 2 CVNs Intersection Analysis Summary

17	Silver Strand Blvd (SR-75) & Hooper Blvd*	**		15.5 (B)	52.8 (D)	12.2 (B)	31.9 (C)	**		**	

Notes: P947 is a MILCON project that would construct a new ECP at SSTC-South along SR-75.

*Delay shown represents a signalized intersection and P947 improvements; the existing unsignalized intersection configuration would operate at LOS F. ** Intersection does not exist under this scenario
Table reflects intersection Delay (LOS). **Bold** indicates intersections operating at an unacceptable LOS E or F. **Bold and shaded** cells indicate locations where the project has an impact.

Plus Project Conditions

Alternatives 1 and 2

Alternative 1 would have the same external improvements and reallocation of personnel as Alternative 2. Therefore, the analysis for Alternative 1 would be identical to the findings for Alternative 2.

Road Network

The only roadway network change associated with Alternative 1 is implementation of P947, which would install a new ECP at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 1.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 was added to the No-Action Alternative volumes. **Figure 6-7** shows the Year 2024 Alternative 1 Conditions volumes with 2 CVNs in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS F)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS F)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #11 Silver Strand Boulevard (SR-75) and Fiddler's Cove Dwy	<i>PM peak (LOS E)</i>
▪ #12 Silver Strand Boulevard (SR-75) and Leyte Road	<i>AM peak (LOS E)</i>
▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave	<i>AM peak (LOS E)</i>
▪ #16 NB Silver Strand Boulevard (SR-75) and Coronado Cays Blvd	<i>AM peak (LOS E)</i>
▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Dr	<i>AM & PM peaks (LOS F/E)</i>
▪ #19 7th Street and Silver Strand Boulevard (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #23 Palm Avenue and Rainbow Drive	<i>AM peak (LOS E)</i>
▪ #26 9th Street and Palm Avenue (SR-75)	<i>AM & PM peaks (LOS F/E)</i>
▪ #28 13th Street and Palm Avenue (SR-75)	<i>PM peak (LOS E)</i>
▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, eight (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. Seven of the eight locations would have impacts with one CVN in port. The intersection of Silver Strand Boulevard (SR-75) and Fiddler's Cove Driveway would be a new impact when two CVNs are in port.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Mitigation

As mentioned, eight study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips with two CVNs in port. At seven of the eight locations, the proposed mitigation measures that would allow the intersections to operate at or better than the No-Action Alternative are the same as those previously described:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

The proposed mitigation for Silver Strand Boulevard (SR-75) and Fiddler's Cove Driveway is described below.

M12. Intersection #11, Silver Strand Boulevard (SR-75) and Fiddlers' Cove Driveway

The significant impact at this intersection during the PM peak-hour can be mitigated by restricting the westbound left-turn movements out of Fiddler's Cove. Vehicles attempting to make a left-turn out of the driveway would have a difficult time finding a gap in traffic. Further, this movement has been identified as a safety concern by the Navy in the past. If the left-turn movement was restricted, vehicles exiting Fiddler's Cove would be forced to make a right-turn and head northbound on Silver Strand Boulevard (SR-75). While this proposed recommendation improves operations and safety at the intersection, it would be inconvenient for vehicles wanting to go south on Silver Strand Boulevard (SR-75). Currently, there is not a place to make a U-turn for northbound traffic until the intersection with Tarawa Road, approximately 1.6 miles north of Fiddler's Cove Driveway. This mitigation measure results in the intersection operating at LOS B and LOS C during the AM and PM peak-hours, respectively. The City of Coronado has requested that this intersection is evaluated under separate environmental review at a later date to determine when, if, and what type of traffic control safety measures are necessary at this location.

Table 6-9 summarizes the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-9. Year 2040 with 2 CVNs Alternative 1 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.9 (A)	121.2 (F)	3.9 (A)	46.3 (D)
11 Silver Strand Blvd (SR-75) & Fiddler's Cove Dwy	Restrict westbound left turns	34.7 (D)	35.5 (E)	34.7 (D)	11.7 (B)
18 Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	204.3 (F)	86.7 (E)	86.5 (F)	42.9 (D)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	158.0 (F)	87.6 (F)	78.1 (E)	62.4 (E)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	92.2 (F)	77.0 (E)	52.7 (D)	54.9 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	44.9 (D)	79.6 (E)	45.6 (D)	55.0 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	103.6 (F)	259.3 (F)	68.4 (E)	142.8 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	73.7 (E)	87.0 (F)	73.7 (E)	87.0 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

The only roadway network change associated with Alternative 3 is implementation of P947, which would install a new ECP at SSTC-South and signalize the intersection of Silver Strand Boulevard (SR-75) and Hooper Boulevard. All other roadways and intersections within the study area would remain the same with the addition of Alternative 3.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 was added to the No-Action Alternative volumes. **Figure 6-8** shows the Year 2024 Alternative 3 Conditions volumes with 2 CVNs in port.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS F)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS F)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS F)</i>
▪ #9 Strand Way and Guadalcanal Road	<i>PM peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #11 Silver Strand Boulevard (SR-75) and Fiddler's Cove Dwy	<i>AM peak (LOS E)</i>

▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, eight (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. Seven of the eight locations are the same intersections that would have impacts with one CVN in port. The intersection of Orange Avenue (SR-75) and Fourth Street (SR-75) would be an additional impact when two CVNs are in port.

Intersection Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would be below or approaching capacity during both peak periods.

Mitigation

As mentioned, eight study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips. At seven of the eight locations, the proposed mitigation measures that would allow the intersections to operate at or better than the No-Action Alternative are the same as those previously described:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M2] Intersection #18, Silver Strand Boulevard (SR-75) and Rainbow Drive
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

As previously noted for Year 2024 with two CVNs and Alternative 3, no feasible mitigation was found at the intersection of Orange Avenue (SR-75) and Fourth Avenue (SR-75).

A summary of the mitigations and the operation analysis results with the mitigations in place are shown in **Table 6-10**.

Table 6-10. Year 2040 with 2 CVNs Alternative 3 Intersection Mitigation Summary

INTERSECTION		PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
4	Orange Ave (SR-75) & Fourth Ave (SR-75)	None [significant and unavoidable]	38.3 (D)	108.4 (F)	38.3 (D)	108.4 (F)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.8 (A)	119.7 (F)	3.8 (A)	45.7 (D)
18	Silver Strand Blvd (SR-75) & Rainbow Dr	Change through-right lane on Rainbow Dr to a left-through-right lane and extend storage pockets	194.6 (F)	78.9 (E)	80.2 (F)	42.6 (D)
19	7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	154.0 (F)	85.3 (F)	72.5 (E)	59.6 (E)
26	9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	85.3 (F)	72.4 (E)	52.1 (D)	53.2 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	43.6 (D)	75.3 (E)	49.6 (D)	53.3 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	99.3 (E)	253.2 (F)	66.5 (E)	126.5 (F)
31	I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	70.3 (E)	85.7 (F)	70.3 (E)	85.7 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Plus Project without P947 Conditions

As previously mentioned, the implementation of P947 provides traffic relief from the local streets within Imperial Beach by shifting access to SSTC-South onto SR-75. This scenario was analyzed to determine traffic impacts if P947 is not constructed until the end of the ten-year development period, or not implemented at all.

Alternatives 1 and 2

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 1 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 1 without P947 was added to the No-Action Alternative volumes. **Figure 6-9** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

- | | |
|--|------------------------------------|
| ▪ #1 Glorietta Boulevard and Fourth Street (SR-75) | <i>AM peak (LOS F)</i> |
| ▪ #2 Fourth Street (SR-75) and Pomona Avenue | <i>PM peak (LOS F)</i> |
| ▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road | <i>PM peak (LOS E)</i> |
| ▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road | <i>PM peak (LOS F)</i> |
| ▪ #12 Silver Strand Boulevard (SR-75) and Leyte Road | <i>AM peak (LOS E)</i> |
| ▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave | <i>AM peak (LOS E)</i> |
| ▪ #16 NB Silver Strand Boulevard (SR-75) and Coronado Cays Blvd | <i>AM peak (LOS E)</i> |
| ▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive | <i>AM peak (LOS F)</i> |
| ▪ #19 7th Street and Silver Strand Boulevard (SR-75) | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #21 Silver Strand Boulevard and Palm Avenue | <i>PM peak (LOS F)</i> |
| ▪ #22 3rd Street and Palm Avenue | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #23 Palm Avenue and Rainbow Drive | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #26 9th Street and Palm Avenue (SR-75) | <i>AM & PM peaks (LOS F/F)</i> |
| ▪ #28 13th Street and Palm Avenue (SR-75) | <i>PM peak (LOS F)</i> |
| ▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75) | <i>AM & PM peak (LOS F/F)</i> |
| ▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75) | <i>AM & PM peak (LOS F/F)</i> |

Of the intersections that operate at an unacceptable LOS E or F, nine (shown in **bold**) would result in a significant impact that would need to be mitigated by the project. All nine of the impacts were also impacts with one CVN in port.

The addition of Alternative 1 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, nine study intersections would experience significant impacts that would require mitigation with the addition of Alternative 1 project trips without P947. The following mitigation measures identified previously would apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

Table 6-11 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-11. Year 2040 with 2 CVNs Alternative 1 without P947 Intersection Mitigation Summary

INTERSECTION	PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
		AM	PM	AM	PM
10 Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.9 (A)	119.9 (F)	3.9 (A)	83.9 (F)
19 7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	150.5 (F)	82.2 (F)	52.1 (D)	50.1 (D)
21 Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	31.3 (D)	>1000 (F)	7.0 (A)	25.3 (C)
22 3 rd St & Palm Ave	Install a traffic signal	170.6 (F)	390.5 (F)	9.0 (A)	21.8 (C)
23 Palm Ave & Rainbow Dr	Restrict SB left-turn movement	436.0 (F)	722.4 (F)	12.1 (B)	15.0 (C)
26 9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	102.8 (F)	84.6 (F)	53.2 (D)	52.2 (D)
28 13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	47.5 (D)	86.5 (F)	45.3 (D)	55.0 (D)
30 Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	109.9 (F)	286.6 (F)	78.9 (E)	136.8 (F)
31 I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	80.9 (F)	89.2 (F)	80.9 (F)	89.2 (F)

Note: Table reflects intersection Delay (LOS). Although all mitigations may not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

Alternative 3

Road Network

It is assumed that all intersections and roadway segments in the study area would remain the same as Existing Conditions with the development of Proposed Action Alternative 3 without P947.

Traffic Volumes

Traffic associated with the completed construction of the Proposed Action Alternative 3 without P947 was added to the No-Action Alternative volumes. **Figure 6-10** shows the resulting volumes.

Intersection Analysis

All intersections would operate at LOS D or better during both peak periods, except at the following locations:

▪ #1 Glorietta Boulevard and Fourth Street (SR-75)	<i>AM peak (LOS F)</i>
▪ #2 Fourth Street (SR-75) and Pomona Avenue	<i>PM peak (LOS F)</i>
▪ #4 Orange Avenue (SR-75) and Fourth Street (SR-75)	<i>PM peak (LOS F)</i>
▪ #8 Silver Strand Boulevard (SR-75) and Tarawa Road	<i>PM peak (LOS F)</i>
▪ #9 Strand Way & Guadalcanal Road	<i>PM peak (LOS E)</i>
▪ #10 Silver Strand Boulevard (SR-75) and Tulagi Road	<i>PM peak (LOS F)</i>
▪ #11 Silver Strand Boulevard (SR-75) and Fiddler's Cove Dwy	<i>AM peak (LOS E)</i>
▪ #12 Silver Strand Boulevard (SR-75) and Leyte Road	<i>AM peak (LOS E)</i>
▪ #13 Silver Strand Boulevard (SR-75) and Attu Ave	<i>AM peak (LOS E)</i>
▪ #16 NB Silver Strand Boulevard (SR-75) and Coronado Cays Blvd	<i>AM peak (LOS E)</i>
▪ #18 Silver Strand Boulevard (SR-75) and Rainbow Drive	<i>AM peak (LOS F)</i>
▪ #19 7th Street and Silver Strand Boulevard (SR-75)	<i>AM & PM peaks (LOS F/F)</i>
▪ #21 Silver Strand Boulevard and Palm Avenue	<i>PM peak (LOS F)</i>
▪ #22 3rd Street and Palm Avenue	<i>AM & PM peaks (LOS F/F)</i>
▪ #23 Palm Avenue and Rainbow Drive	<i>AM & PM peaks (LOS F/F)</i>
▪ #26 9th Street and Palm Avenue (SR-75)	<i>AM & PM peaks (LOS F/E)</i>
▪ #28 13th Street and Palm Avenue (SR-75)	<i>PM peak (LOS F)</i>
▪ #30 Saturn Boulevard/19th Street and Palm Avenue (SR-75)	<i>AM & PM peak (LOS F/F)</i>
▪ #31 I-5 SB Exit Ramp and Palm Avenue (SR-75)	<i>AM & PM peak (LOS E/F)</i>

Of the intersections that operate at an unacceptable LOS E or F, ten (shown in **bold**) would result in a significant impact that would need to be mitigated by the project.

The addition of Alternative 3 traffic without P947 would result in three additional impacts on local streets in Imperial Beach that would not be impacts if P947 were in place.

Intersecting Lane Vehicle Analysis

Both signalized intersections at the Palm Avenue and I-5 interchange would operate below or approaching capacity during both peak periods.

Mitigation

As mentioned, ten study intersections would experience significant impacts that would require mitigation with the addition of Alternative 3 project trips without P947. The mitigation measures identified for Alternative 1 would also apply for this scenario:

- [M1] Intersection #10, Silver Strand Boulevard (SR-75) and Tulagi Road
- [M3] Intersection #26, 9th Street and Palm Avenue (SR-75)
- [M4] Intersection #28, 13th Street and Palm Avenue (SR-75)
- [M5] Intersection #30, Saturn Boulevard/19th Street and Palm Avenue (SR-75)
- [M6] Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)
- [M7] Intersection #21, Silver Strand Boulevard and Palm Avenue
- [M8] Intersection #22, 3rd Street and Palm Avenue
- [M9] Intersection #23, Palm Avenue and Rainbow Drive
- [M11] Intersection #31, I-5 Southbound Exit Ramp and Palm Avenue (SR-75)

Table 6-12 summarizes all of the mitigation measures and shows the intersection delay and LOS with the proposed mitigation measures in place.

Table 6-12. Year 2040 with 2 CVNs Alternative 3 without P947 Intersection Mitigation Summary

INTERSECTION		PROPOSED MITIGATION	BEFORE MITIGATION		AFTER MITIGATION	
			AM	PM	AM	PM
4	Orange Ave (SR-75) & Fourth Ave (SR-75)	None [significant and unavoidable]	38.1 (D)	108.9 (F)	38.1 (D)	108.9 (F)
10	Silver Strand Blvd (SR-75) & Tulagi Rd	Change signal timings to reflect new traffic patterns	3.9 (A)	118.4 (F)	3.9 (A)	82.8 (F)
19	7 th St & Silver Strand Blvd (SR-75)	Stripe a southbound left-turn pocket	149.6 (F)	82.1 (F)	52.6 (D)	50.5 (D)
21	Silver Strand Blvd & Palm Ave	Widen Silver Strand Boulevard, install traffic signal	25.2 (D)	879.9 (F)	6.7 (A)	19.1 (B)
22	3 rd St & Palm Ave	Install a traffic signal	116.4 (F)	308.8 (F)	8.4 (A)	14.4 (B)
23	Palm Ave & Rainbow Dr	Restrict SB left-turn movement	274.3 (F)	463.5 (F)	12.0 (B)	14.6 (B)
26	9 th St & Silver Strand Blvd (SR-75)	Modify northbound/southbound approaches to have protected lefts instead of split phasing	94.0 (F)	78.4 (F)	45.5 (D)	50.8 (D)
28	13 th St & Palm Ave (SR-75)	Remove the northbound pedestrian crossing and shorten the northbound split time	45.3 (D)	80.8 (F)	44.3 (D)	53.1 (D)
30	Saturn Blvd/19 th St & Palm Ave (SR-75)	Add a second WB left-turn lane along Palm Ave (SR-75)	104.4 (F)	260.8 (F)	68.8 (E)	131.9 (F)
31	I-5 SB Exit Ramps & Palm Ave (SR-75)	Extend storage length for southbound right on exit ramp	75.0 (E)	87.4 (F)	75.0 (E)	87.4 (F)

Note: Table reflects intersection Delay (LOS). Although the mitigation does not improve operations to LOS D or better, it restores average delay to better than what is experienced under the No-Action Alternative.

7.0 OTHER CONSIDERATIONS

Site Access

The Proposed Action includes MILCON P947, implementation of a new ECP on the northern end of SSTC-South that would provide access to Silver Strand Boulevard (SR-75) from an existing intersection location. As part of P947, the existing intersection would require a major overhaul, planned to include installation of a traffic signal, addition of a southbound right-turn lane, and lengthening of the northbound left-turn lane. The upgraded intersection and new ECP would become the main entrance to SSTC-South and provide adequate capacity for the trip generation defined in this study. As a result, the existing ECP in Imperial Beach would no longer be the main access point and would become a secondary ECP that could be used in a variety of ways to balance traffic demand and maintain a connection between SSTC-South and Imperial Beach. Some examples of the limited use include:

- Relieve traffic on the external street network during times of extraordinary traffic demand;
- Open during mid-day lunch hours to encourage shopping and eating at nearby Imperial Beach establishments; and
- Used as a pedestrian and bicycle entrance for users coming from the Imperial Beach area

If P947 is not implemented as part of the ultimate development of the Proposed Action or developed late in the ten-year build-out schedule there will be several additional impacts to the roadway network as reflected in the analysis results, primarily along the local streets of Imperial Beach. Several intersections along Palm Avenue would degrade from minimal delays, minimum queuing, and acceptable operations to extreme delays, long queues, and unacceptable operations. Further, the existing ECP for SSTC-South, located in Imperial Beach on Silver Strand Boulevard north of Palm Avenue, is not designed to accommodate the traffic volumes that the Proposed Action is anticipating. Delays and queues may be worse than what is represented in the analysis results due to heavy queues at the ECP caused by vehicle processing procedures required to maintain security. Furthermore, construction vehicles will need to access SSTC-South during the development of the Proposed Action and would further worsen traffic operations.

For the above reasons, it is recommended that P947 be implemented as early as possible in the Proposed Action development to prevent excessive traffic volumes in Imperial Beach and provide appropriate capacity and security facilities to process the increasing number of vehicles accessing SSTC-South.

Access to SR-75

As part of P947, the Navy will need to coordinate with Caltrans on design and construction of the proposed improvements to the existing access on SR-75. The current access is uncontrolled on SR-75 with a 50-foot northbound left-turn pocket and no dedicated southbound right-turn lane. The existing configuration of the intersection is illustrated in **Figure 7-1**. The projected Year 2040 volumes with 2 CVNs in port and completion of the Proposed Action are also shown on Figure 7-1. To handle the projected volumes at this location with the development of the Proposed Action, it is proposed to add a traffic signal, extend the northbound left-turn pocket, construct an exclusive southbound right-turn pocket, and widen the west leg to have two inbound and three outbound lanes for SSTC-South. The proposed traffic signal would include a crossing that connects to Bayshore Bikeway and signal timing features for bicycles and pedestrians. A conceptual layout of the traffic signal and improvements are illustrated in **Figure 7-2**. It should be noted that although the design of internal roadway layout has not been determined, adequate queuing and storage length for the base security operations to occur shall be provided. It is estimated that the length will be at least 500 feet from the intersection.

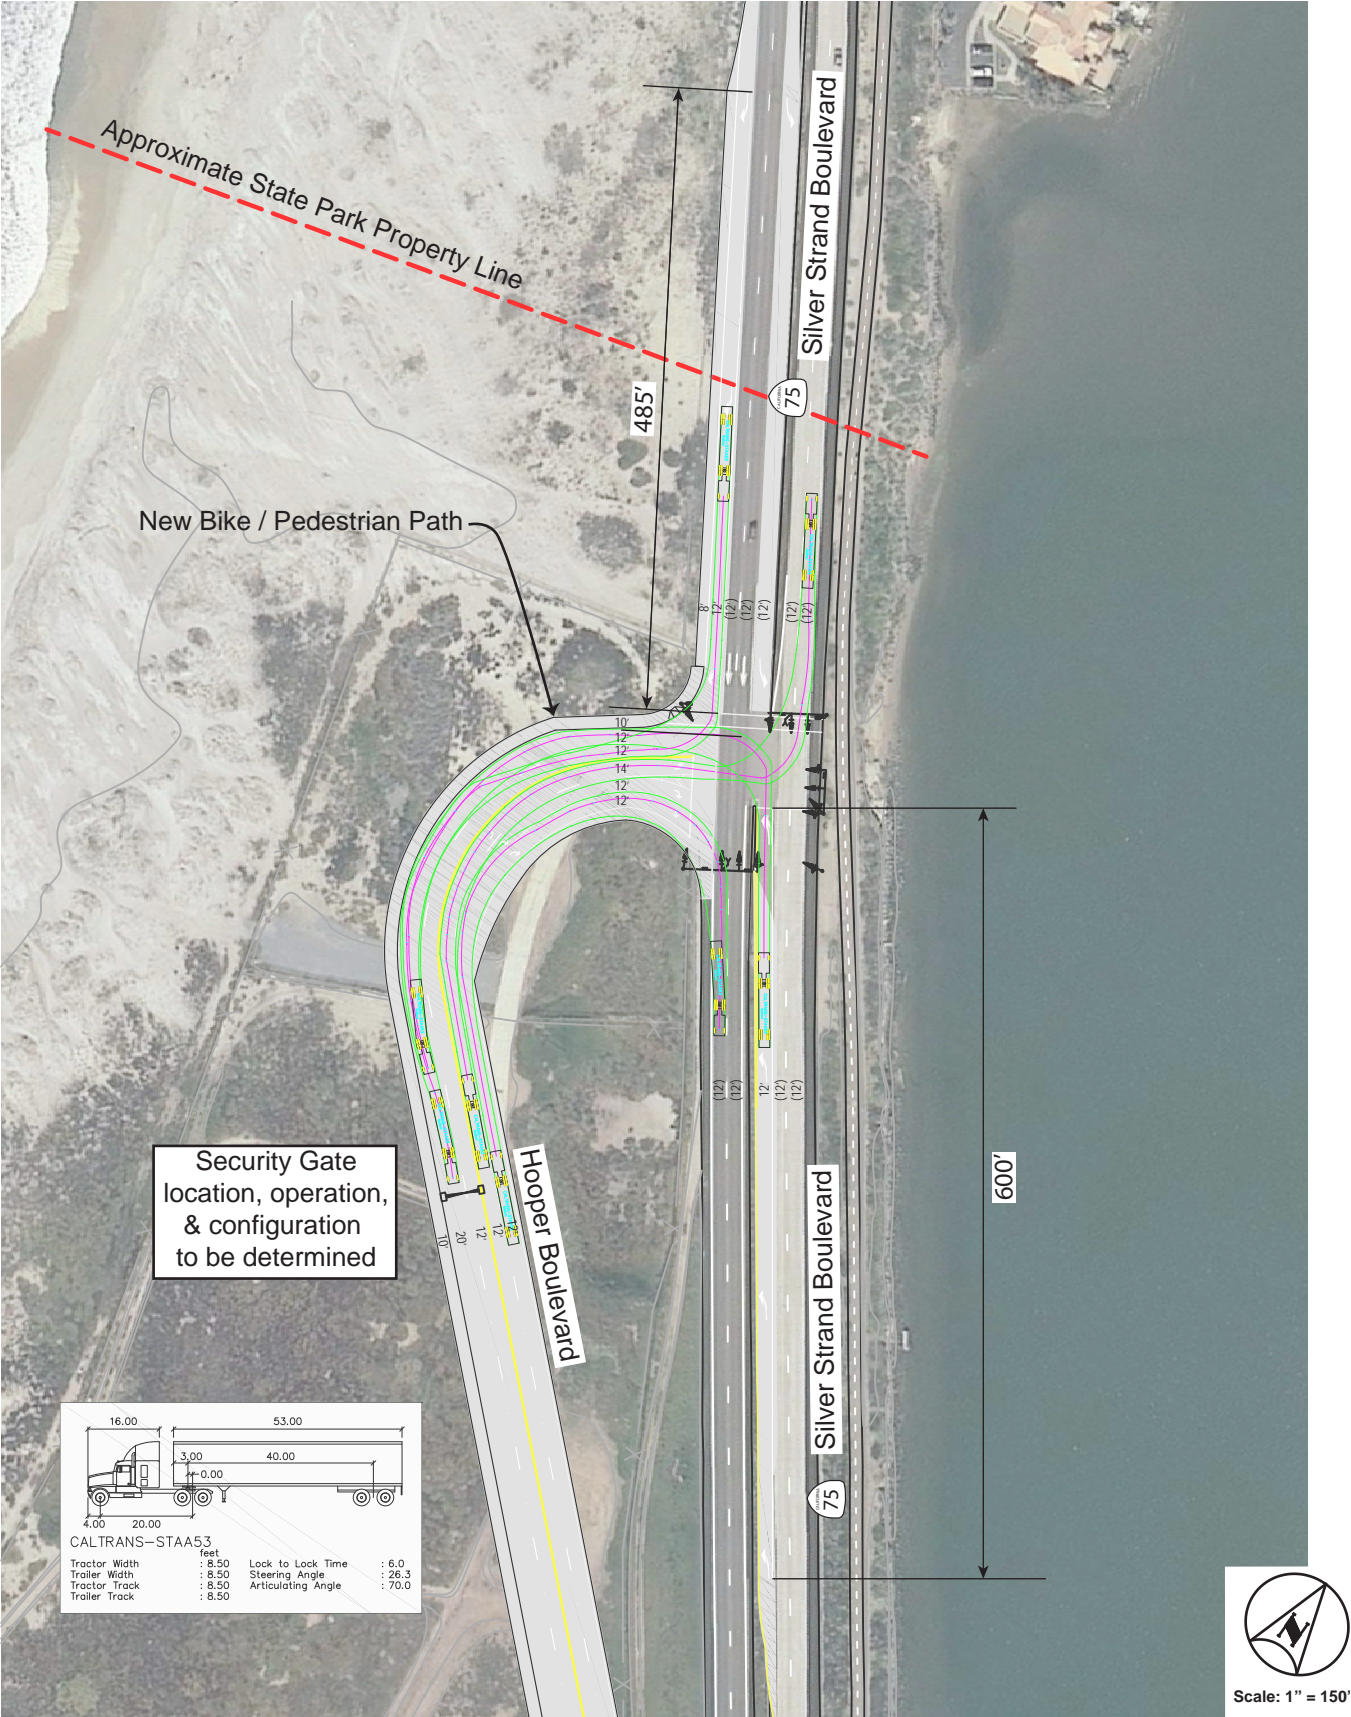

FIGURE 7-2

Intersection analysis was performed at this location for three scenarios under Year 2040 with 2 CVNs conditions: no improvements, proposed traffic signal improvements, and a roundabout option. The results are presented in **Table 7-1**. As shown, the intersection would operate at LOS D or better during both peak periods with the proposed traffic signal improvements. A roundabout would operate at LOS F during both peak periods and is not considered to be a reasonable option at this location.

Table 7-1. Year 2040 (2 CVNs) Peak-Hour Intersection Analysis at Hooper Blvd / SR-75

INTERSECTION		EXISTING LAYOUT		WITH TRAFFIC SIGNAL		WITH ROUNDABOUT	
		AM	PM	AM	PM	AM	PM
17	Silver Strand Blvd (SR-75) & Hooper Blvd	404.6 (F)	ECL (F)	15.5 (B)	52.8 (D)	73.1 (F)	77.4 (F)

Note: Table reflects intersection Delay (LOS). ECL = Exceed Calculable Limit. Roundabout analysis was performed using SIDRA software.

Queuing analysis was performed with the conceptual layout in place and some delays associated with ECP operations on Hooper Boulevard. The results are presented in **Table 7-2**. The proposed storage lengths of the northbound left-turn lane (600 feet) and southbound right-turn lane (485 feet) were determined based on the queuing analysis results, anticipated volumes, and Caltrans design criteria for 55 miles per hour.

Table 7-2. Year 2040 (2 CVNs) Queuing Intersection Analysis at Hooper Blvd / SR-75

		NBL	600 ft	185	428	117	242
		SBR	485 ft	0	38	0	22

Note: Table presents 50th and 95th percentile queues. Design features are based on the 95th percentile queues. Analysis assumes two lanes in each direction on Hooper Boulevard.

A signal warrant analysis was prepared to determine if a signal would be warranted by Year 2024 conditions and is provided in **Appendix J**. With the limited information available for a planning-level study only certain warrants were able to be analyzed. Nonetheless, the intersection was found to meet peak hour warrants during Year 2024.

Construction Traffic

The Proposed Action consists of 25 MILCONs over a ten-year period. Construction activity will vary depending on the facilities being built and the amount of MILCONs underway concurrently. Although the timing of MILCONs has been tentatively planned, actual construction activity will depend on the alternative selected, final design of the campus, funding, and available resources. All of the action alternatives would require similar construction activity, albeit may be at different locations. A key component of the final design and difference between Alternatives 1 and 2 is determining if the existing bunker at SSTC-South will be removed (Alternative 1) or will remain as part of the campus (Alternative 2). Removal of a bunker requires an extraordinary amount of soil removal and would require heavy trucking activity. A key component of Alternative 3 is that some construction activity would occur at NAB Coronado and NASNI in addition to SSTC-South. Alternative 3 would preserve the bunker.

Construction traffic was estimated with the information known at the time of this study. The following assumptions were made for NBC Coastal Campus using known information on the project and input from Navy staff with experience in similar construction projects:

- There are 25 MILCON projects adding traffic to the existing traffic
- Construction of each MILCON would last two years.
- P876 begins construction in 2014
- P797 and P915 begin construction in 2015 although obtaining funding earlier.
- All other MILCONs would start the year after gaining funding. For example, FY2016 projects begin in 2017.
- # of Construction Workers per day varies by size of building:
 - square feet < 25,000: 1 worker per 750 square feet
 - $25,000 \leq \text{square feet} < 75,000$: 1 worker per 1,000 square feet
 - $75,000 \leq \text{square feet}$: 1 worker per 1,500 square feet
- Construction Worker Daily Trips: Average of 3 trips per construction worker per day (one inbound, one outbound, one non-peak)
- # of Construction Delivery Trucks per day: Average of 1 truck per 10,000 square feet
- Construction Delivery Truck Daily Trips: Average of 2 trips per truck per day (one inbound, one outbound)
- Total Construction Daily Trips = [# of Construction Delivery Trucks * passenger car equivalent factor (2.5) * # of trips per truck (2)] + [# of Construction Workers * # of trips per worker (3)]
- Total Construction Peak-Hour Trips = [# of construction workers + 0.25 * # of construction delivery trucks]. All peak-hour trips are inbound in the morning and outbound in the afternoon and the same number of trips would occur in the morning and afternoon peak hour.
- For Alternative 1 bunker removal is required and would have additional construction traffic when compared to Alternative 2 which does not require bunker removal. Construction traffic estimates for bunker removal include:
 - One roundtrip truck trip every five minutes, equal to 12 trucks per hour in each direction.
 - Trips were applied to each peak hour equally, assuming a constant flow of trucks all day at the above rate of 12 trucks per hour per direction.

Based on these assumptions, construction traffic was estimated for each year between 2015 and 2023 for each of the Alternatives.

It is important to note that as the construction projects are completed the finished buildings are planned to be open for operations immediately. Thus, the roadway network will experience a combination of operational traffic and construction traffic during the buildout of the Proposed Action. To account for this in the construction traffic analysis, trip generation for each building was estimated using the same methodology used for the full build-out of the project and applied to the network the year after construction completion. The number of personnel for each construction project was provided by Navy staff to assist the trip generation effort. All personnel using SSTC-South or NASNI during construction years were assumed to be personnel relocating from NAB Coronado.

Two different construction scenarios were evaluated:

“North only” assumes that all construction traffic would access SSTC-South through the location of the new north gate, Intersection 17 –Silver Strand Boulevard (SR-75) and Hooper Boulevard, and would use Palm Avenue (SR-75) to traverse between I-5 and the SSTC-South access point. Similarly, all operational traffic would access SSTC-South through the location of the new north gate. The trip distribution methodology for operational traffic is consistent with the methodology used for full build-out of the project. This scenario assumes that a proper ECP and proposed intersection improvements outside the ECP are completed. “North only” construction scenario summary tables are provided as follows:

- **Table 7-3a** shows the resulting traffic operations for years 2015 – 2023 as construction is being completed at SSTC-South for Alternative 1, which assumes bunker removal.
- **Table 7-3b** shows the resulting traffic operations for years 2016 – 2017 for Alternative 2, which assumes the bunker remains. The table only shows the two years that would be different than Alternative 1. The results for the other years of construction would be identical to what is shown in Table 7-3a.
- **Table 7-3c** shows the resulting traffic operations for years 2021 – 2023 for Alternative 3. The key component of Alternative 3 is that it would include construction of a single facility (P-870) at NASNI and three facilities (P-904, P-912, and P-965) at NAB Coronado. Each of these facilities are planned to begin construction in 2021. Thus, for years 2015 – 2020 the results of construction traffic activity would be identical to Alternative 2, shown in Table 7-3b.

“Construction North, Operations South” assumes that all construction traffic would access SSTC-South through the location of the new north gate, Intersection 17 –Silver Strand Boulevard (SR-75) and Hooper Boulevard, and would use Palm Avenue (SR-75) to traverse between I-5 and the SSTC-South access point. It assumes that all operational traffic would access SSTC-South through the existing south gate in Imperial Beach. This scenario assumes the new ECP may not be in place during the construction years. Proper security checkpoint procedures would still occur at the existing access for non-construction activity. “Construction North, Operations South” construction scenario summary tables are provided as follows:

- **Table 7-4a** shows the resulting traffic operations for years 2015 – 2023 as construction is being completed at SSTC-South for Alternative 1.
- **Table 7-4b** shows the resulting traffic operations for years 2016 – 2017 for Alternative 2 and only shows the two years that would be different than Alternative 1.
- **Table 7-4c** shows the resulting traffic operations for years 2021 – 2023 for Alternative 3.

For all scenarios, the construction year intersection operation summary tables show the difference in traffic operations between the existing layout and a signal improvement at intersection 17, Hooper Boulevard and Silver Strand Boulevard (SR-75). As previously described, this intersection is planned to have a signal installed as part of the new ECP project in addition to an exclusive southbound right-turn lane and extension of the existing northbound left-turn lane. All construction year analyses assumed 2 CVNs in port.

Table 7-3a. “North Only” Construction Scenario - Alternative 1 Intersection Traffic Analysis Summary with 2 CVNs

Notes: Table reflects intersection Delay (LOS). **Bold and shaded** cells indicate locations where the project has a temporary impact during construction. The temporary measures at intersection 17 include an exclusive southbound right-turn lane and extension of the existing northbound right-turn lane.

As shown in the tables, construction traffic will have impacts to the roadway network immediately at six locations along SR-75. Impacts continue to add on as the development intensity increases and buildings are opened for use. Year 2017 is when the intersections through Imperial Beach have impacts and represents an oversaturation of the existing roadway network in Imperial Beach for the “Construction North, Operations South” scenario.

At Hooper Boulevard and Silver Strand Boulevard (SR-75), the PM peak fails by Year 2015 as vehicles making the eastbound right-turn out of SSTC-South have excessive delay trying to find a gap in southbound through traffic. This situation is fixed with implementation of a traffic signal as the signal provides eastbound traffic protected time to enter SR-75 while southbound traffic is stopped with a red light. Few other improvements would provide relief for eastbound traffic. Planned turn lane improvements do not help with the delay for this particular movement as they do not affect the eastbound right-turn nor southbound through movements. A temporary traffic signal or a flagger controlling traffic would essentially function the same as a permanent traffic signal, just on a temporary basis. A signal is warranted in 2015 based on the peak hour volumes. Signal warrant analysis information is provided in **Appendix J**. The AM peak hour at this location would operate at acceptable levels since northbound left-turn traffic is able to find gaps in the low volumes of southbound traffic during the AM peak hour. However, extension of the northbound left-turn pocket should be considered to provide storage area for more than the existing 50 feet, which is about equal to the length of two passenger car vehicles or one heavy construction truck.

Regardless of the selected Alternative, some impact avoidance and minimization measures to consider for construction include:

- Construct the new ECP on Silver Strand Boulevard (SR-75) early in the construction schedule or provide temporary access at the ultimate new ECP location to minimize construction traffic in the residential neighborhoods of Imperial Beach;
- Install a traffic signal and make turn lane improvements at the intersection of Hooper Boulevard and Silver Strand Boulevard (SR-75) to support construction activity;
- Include construction management in the design aspect of the NBC Coastal Campus
- Coordinate construction activity with NBC representatives to monitor daily activity levels at each installation and minimize interruptions to operations;
- Schedule heavy vehicle activity during non-peak hours;
- Encourage carpooling and staggered work hours for construction workers; and
- Notify public stakeholders of times where abnormal construction activity would occur (i.e. bunker removal).

Detailed information on construction and operational traffic generation and analysis worksheets are provided in **Appendix K**.

Non-Peak Hour Trips

The peak hour analyses are helpful in identifying locations that operate poorly and identifying mitigation measures to help alleviate congestion. Non-peak hour traffic can also be important to consider if there are abnormal traffic patterns throughout the day. NBC includes multiple facilities that are closely related in operations and require daily interactions. As a result, there are currently non-peak hour trips occurring between facilities within NBC. By collocating facilities that are currently spread out, Alternatives 1 and 2 may actually reduce off-peak hour trips on the study roadway network. Under Alternative 3 Conditions, non-peak hour project-related trips would still occur similar to what occurs today as the facilities are spread between the NAB Coronado, SSTC, and NASNI locations.

Heavy Vehicles

Vehicles on a traffic network all have different characteristics that affect operations. One of the major considerations on a network is the number of heavy vehicles – trucks, buses, and other vehicles larger than typical passenger cars. Heavy vehicles are longer and wider than the average passenger car and also have slower acceleration, slower speeds, and wider turn radius requirements. For these reasons, areas that have a high volume of heavy vehicles experience congestion quicker than areas that are primarily passenger cars. Typical roadway networks have approximately two-percent of its vehicle population fall in the heavy vehicle category. The Proposed Action includes facilities and operations that attract and require heavy vehicles. Understanding the amount of heavy vehicles is important when evaluating the traffic impacts on the external roadway network as well as providing an adequately designed internal street network that can accommodate heavy vehicles. This section discusses the heavy vehicles associated with the Proposed Action and what it means to the adjacent roadway network.

Adjacent Roadway Network Data

Caltrans publishes information on annual average daily truck traffic for their facilities. For each segment that data is collected on, Caltrans provides a percent of which its vehicle population is considered trucks, and provides a summary of heavy vehicle counts sorted by the number of axles. The most recent data available at the time of this study was 2011. **Table 7-5** summarizes the truck volumes provided by Caltrans for key roadway segments in the study area.

Table 7-5. Heavy Vehicle Volumes on Adjacent Roadway Network

Route	Post Mile	Location	Vehicle Total	Truck Total	% Trucks
SR-75	9	Junction with I-5, near Imperial Beach	64,000	1,920	3.0%
SR-75	18.47	Coronado, Pomona Avenue	21,500	409	1.9%
SR-75	19.586	Junction with SR-282 at 4 th Street/ Orange Avenue	21,900	745	3.4%
SR-75	22.261	Junction with I-5, near Coronado	73,000	2004	2.8%
SR-282	0	Junction with SR-75	32,000	960	3.0%

Source: 2011 Annual Average Daily Truck Traffic on the California State highway System, Caltrans.

NBC Truck Generation Data

Traffic counts were obtained in July 2003 as part of the *City Wide Major Traffic Study*, March 15, 2005, that included information on heavy vehicles at several locations throughout the study area and NBC facilities. **Table 7-6** illustrates the percentage of trucks at key locations within the study area. Although this information is ten years old it provides some insight to the percent of trucks that use the NBC facilities and adjacent street network. As shown in the table, the locations with the highest percentage of trucks were near the NASNI First Street gate and NAB Coronado Tarawa Road gate, with approximately two-percent of the vehicles entering being trucks. At the other military gates, the truck percentages were extremely low with less than a percent of the vehicles being trucks.

Table 7-6. Coronado Vehicle Classification Summary

LOCATION	AUTOS	VANS AND BUSES	SEMI TRUCKS	TOTAL	PERCENT HEAVY VEHICLES
NASNI First St Gate	11,164	404	220	11,788	1.9%
NAB Coronado Tarawa Rd Gate	174	11	3	188	1.6%
NAB Coronado Tulagi Rd	415	4	4	423	0.9%
SR-75 at Bridge Toll Plaza	48,404	673	446	49,523	0.9%
Silver Strand Blvd (SR-75) south of Tulagi Rd	19,405	469	101	19,975	0.5%
NAB Coronado Main Gate south of Tarawa Rd	7,308	171	33	7,512	0.4%
NASNI Ocean Blvd Gate	3,829	26	9	3,864	0.2%
NASNI Main Gate (Fourth St)	21,671	247	37	21,955	0.2%
Hotel Del Coronado Dwy	1,940	25	2	1,967	0.1%
Strand Way at Rendova Rd	811	0	0	811	0.0%

Notes:

Traffic counts were performed on a weekday from 5:30 a.m. to 5:30 p.m. in July 2003.

Source: Coronado *City-Wide Major Traffic Study*, dated March 15, 2005.

Proposed Action Heavy Vehicles

Trucks of varying size are common on military bases and are an important consideration in planning a new Campus. Internal roadways need to be sized to accommodate the maneuvering of trucks (turning radius) and the weight of loaded trucks (pavement structural strength). Access to a base needs to consider truck inspection facilities that are separated from passenger inspection lanes. Additionally, routing needs to be established to assign truck traffic to streets and highways that have been designed to accommodate these vehicles. **Figure 7-3** depicts the truck routes that serve the four NBC installations that have regular truck interactions. Supplies and deliveries would enter installations at the designated truck entry gate using approved truck routes. In general the truck facilities serving NBC use the following facilities:

- SR-75 (Palm Avenue, Silver Strand Boulevard, Orange Avenue) is the primary truck route that serves all of NBC. The military does not route large trucks on the San Diego Coronado Bridge. Access to NAB Coronado and future access to the Coastal Campus are from SR-75.
- SR-282 (Third and Fourth Streets) is the primary truck route to access NASNI, with a truck inspection facility just beyond the terminus of Third Street.
- 13th Street in Imperial Beach provides truck access to NOLF-IB.

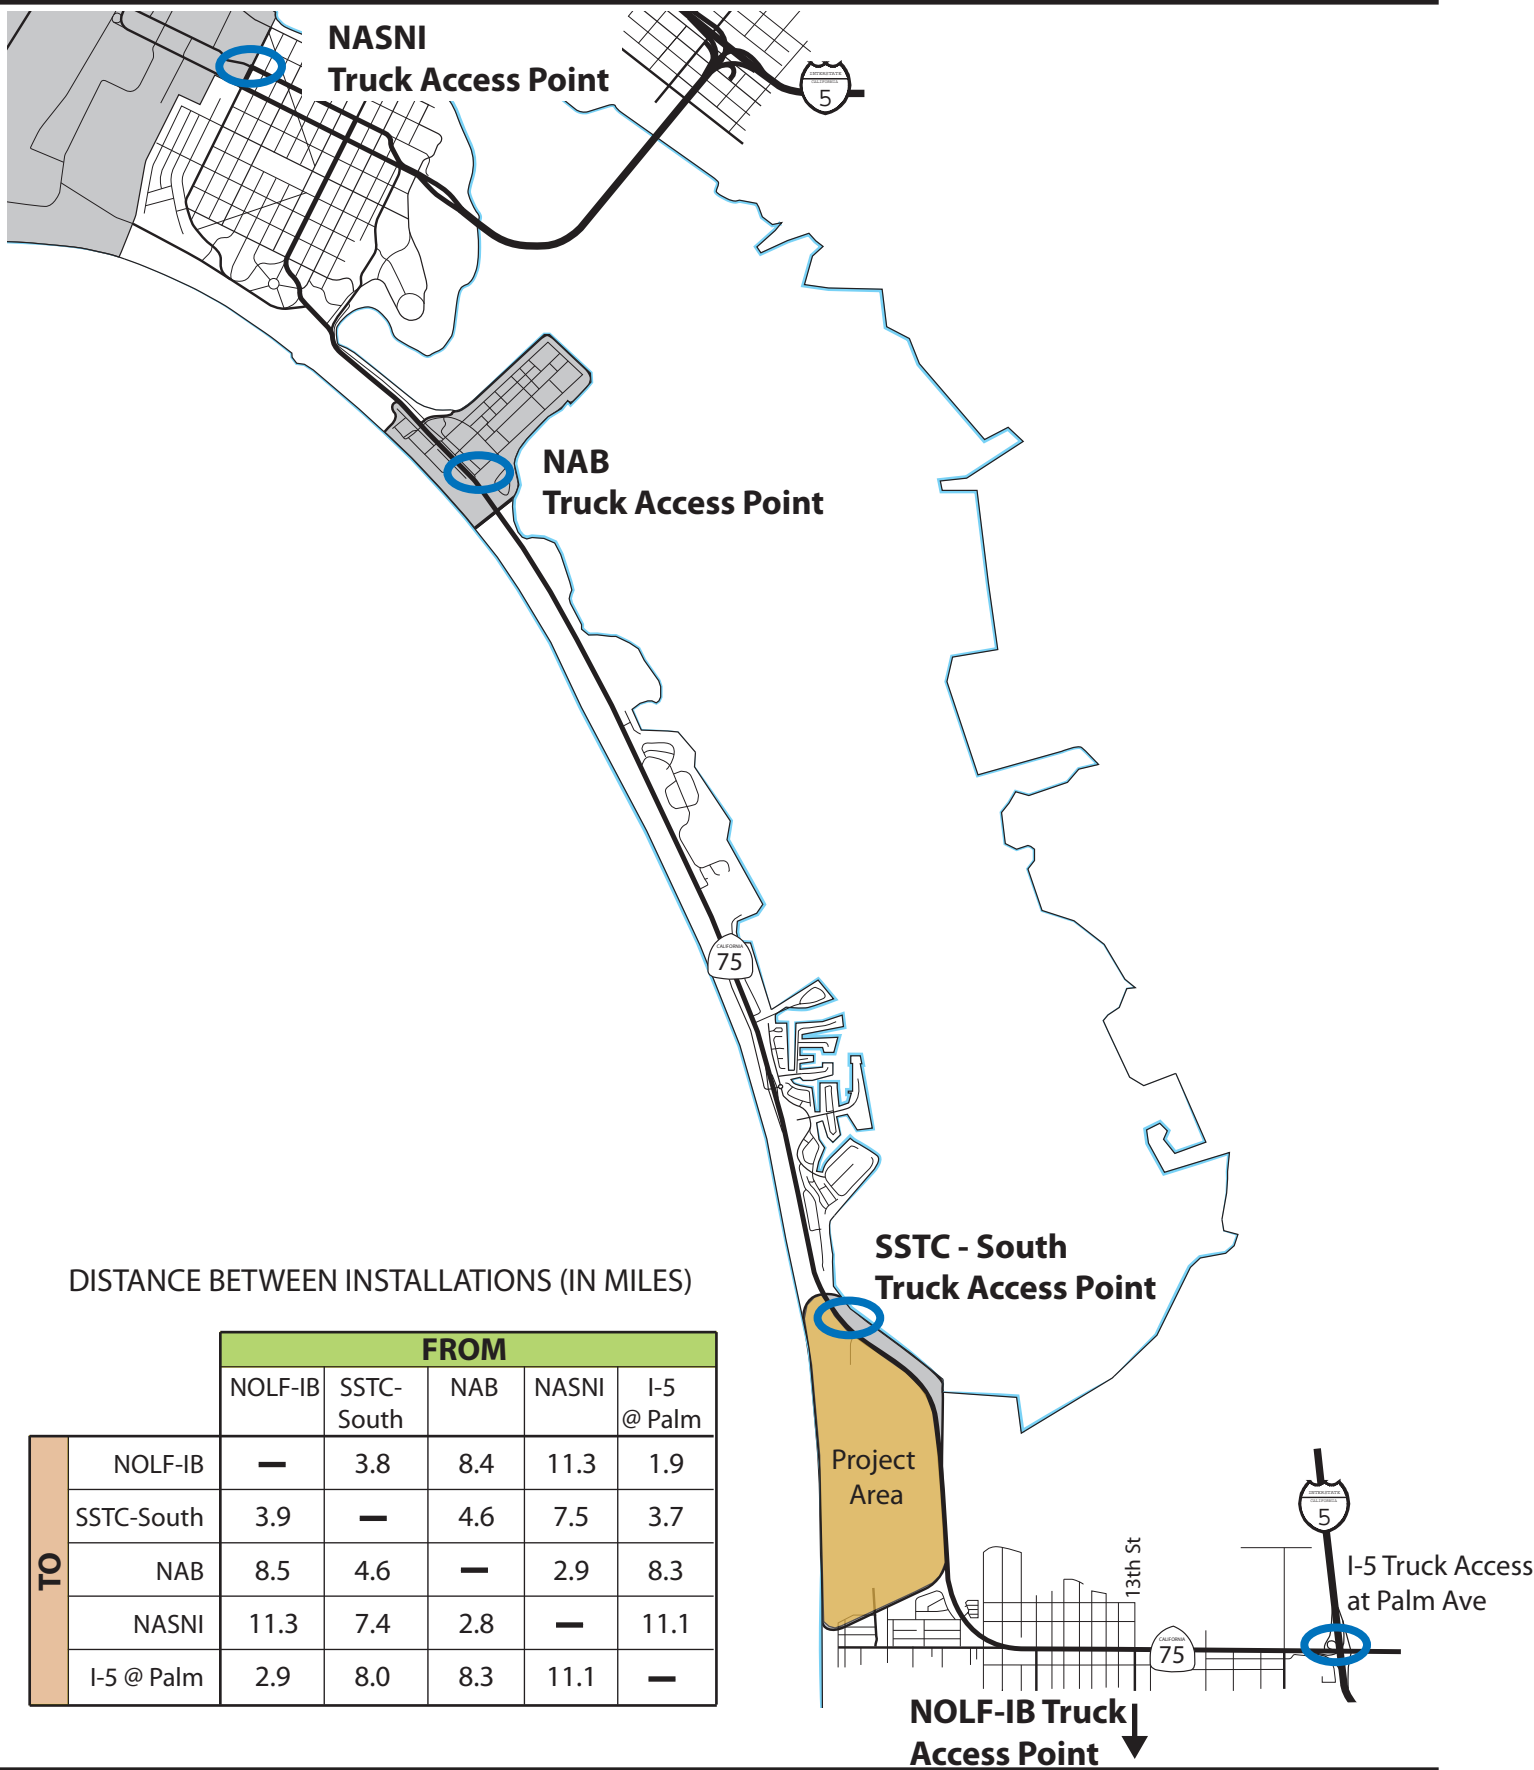

Due to space limitations, the fleet of larger trucks and trailers serving NBC are currently stored at NOLF-IB. These vehicles are checked out to work units when needed for a deployment or relocation of equipment. With implementation of the Proposed Action the truck traffic traversing between NOLF-IB and NAB Coronado is expected to continue, with somewhat lesser impacts than the current arrangement. Trips would follow the same general route, but would be shorter in length and could be reduced in frequency since there will be more storage and laydown space at the new NBC Coastal Campus area in SSTC-South than there currently is at NAB Coronado. There should be a decrease in the amount of traffic, including small trucks and other military vehicles, on Silver Strand Boulevard (SR-75) between SSTC-South and NAB Coronado with implementation of the Proposed Action. Presently personnel stationed at NAB Coronado use SSTC-South for certain training activities. By moving NSW personnel to one primary location, this amount of travel between sites would be reduced.

There would be an increase in the normal amount of truck activity prior to and after a deployment. During these times, there may be as much as three or four extra truck trips per hour in each direction. These increases would occur infrequently and at random times. Several sizes of trucks are used to transport gear and supplies.

As a result of the discussions with NSW and the historical data collected, the industry standard of two-percent was used for the heavy vehicles assigned on the roadway. This results in the following number of heavy vehicles for the Proposed Action:

- 15 truck trips during the morning peak (13 in, 2 out)
- 16 truck trips during the afternoon peak (3 in, 13 out)
- 178 truck trips daily (89 in / 89 out)

Within the new Coastal Campus, internal roadways are being designed to accommodate heavy truck traffic. Truck loading docks, laydown space and loading equipment will be provided to optimize logistical efficiency. To the degree practicable, truck routing on base will be separated from primary pedestrian corridors and vehicular access.

Transit Facilities

Transit facilities provide an alternative mode of transportation that helps reduce traffic demand on the streets, benefits to the environment, and cost savings for commuters. This section discusses the transit system available to the City of Coronado, City of Imperial Beach, and NBC. Transit service routes, frequencies, and ridership are discussed.

The Metropolitan Transit System (MTS) operates two bus routes in the study area, Route 901 and Route 904. Route 901 is the only transit route directly serving SSTC-South. Route 901 runs from Downtown San Diego, across the San Diego-Coronado Bridge, through the City of Coronado to the City of Imperial Beach and the Otay Mesa Community of the City of San Diego. The route travels along both SR-75 and SR-282, and currently provides a transit stop at the NASNI Visitor Center, just west of Alameda Boulevard. The stop is located near the visitor check-in center prior to the stationed guards and does not require security processing. Passengers riding the bus destined for NASNI must walk on base through the guard station. The route provides daily service every 15 minutes on weekdays during peak periods (approximately 5:00 a.m. to 8:00 a.m. and 2:00 p.m. to 4:00 p.m.), and every 30 minutes on weekdays during non-peak periods and weekends. Route 901 is one of the MTS top ten routes for high ridership. **Figure 7-4** shows the routes and stops of Route 901.

Currently there are no stops within reasonable walking distance of SSTC-South. Since more Navy personnel would be destined for SSTC-South with completion of the Proposed Action, regardless of the Alternative, the Proposed Action would need to provide new bus stops to incorporate into Route 901 near SSTC-South to continue encouraging use of transit facilities. The location of the proposed stop(s) should be by the new ECP, as shown in the figure. It is not anticipated that buses would be allowed to enter SSTC-South, but a bus stop along SR-75 or prior to the ECP should be implemented. The new stop would be approximately one-half mile from the center of the new NBC Coastal Campus.

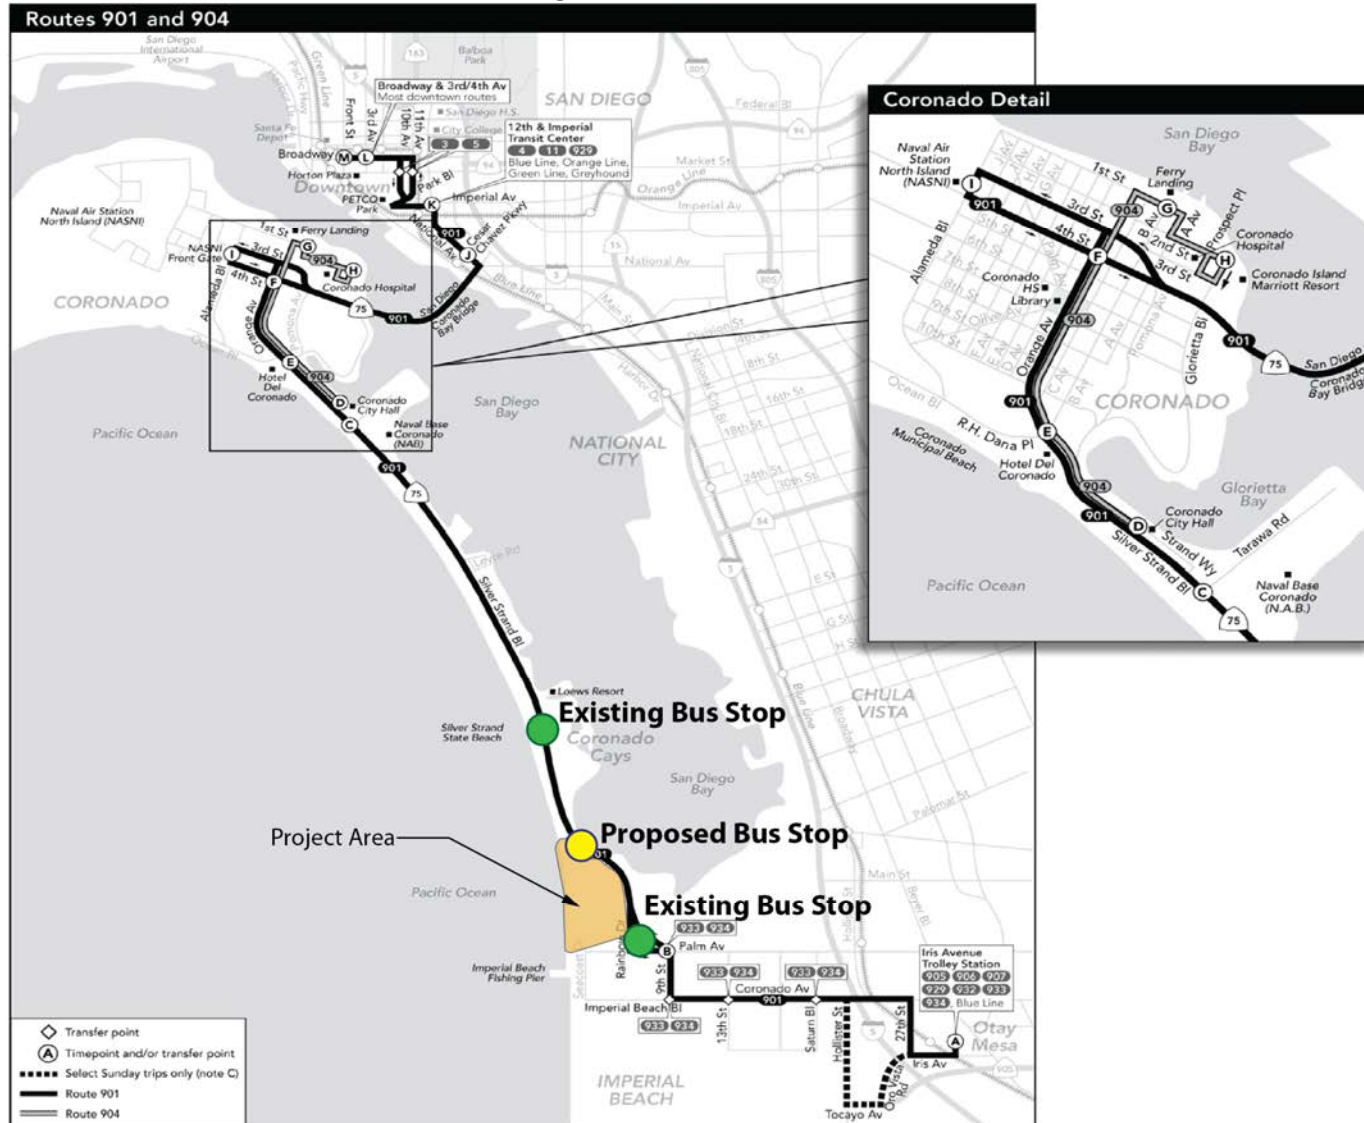

Route 904 provides service within the City of Coronado between the intersection of Third Street and Glorietta Boulevard and the intersection of Silver Strand Boulevard (SR-75) and Avenida de las Arenas. The route travels primarily on Orange Avenue and Silver Strand Boulevard and does not provide direct access to any NBC facility and would not be a reasonable transit option for personnel commuting to SSTC-South.

MTS also operates the San Diego Trolley system, and the Coaster is operated by North County Transit District. These are part of a rail transit network that serves most cities throughout San Diego County. Although the trolley and Coaster systems do not pass through Coronado or Imperial Beach, many commuters to and from the cities and NBC facilities use the trolley in combination with bus or ferry routes. The Blue trolley line serves Downtown San Diego, with stops at major transit centers, including the Santa Fe Depot near the Broadway ferry dock. **Figure 7-5** depicts the Blue Line trolley route and stops closest to SSTC-South. Route 901 provides a bus connection to the trolley system.

Passenger ferry service is available between the City of Coronado and Downtown San Diego. Daily sailings depart every one hour between approximately 9 a.m. to 10 p.m. A commuter ferry runs during peak periods between the Broadway Pier and Coronado Landing Marketplace. These sailings depart every 45 minutes to one hour between approximately 5:30 a.m. to 8:30 a.m. and 2 p.m. to 5 p.m. on Mondays through Fridays. The ferry is operated by the private company Harbor Excursions.

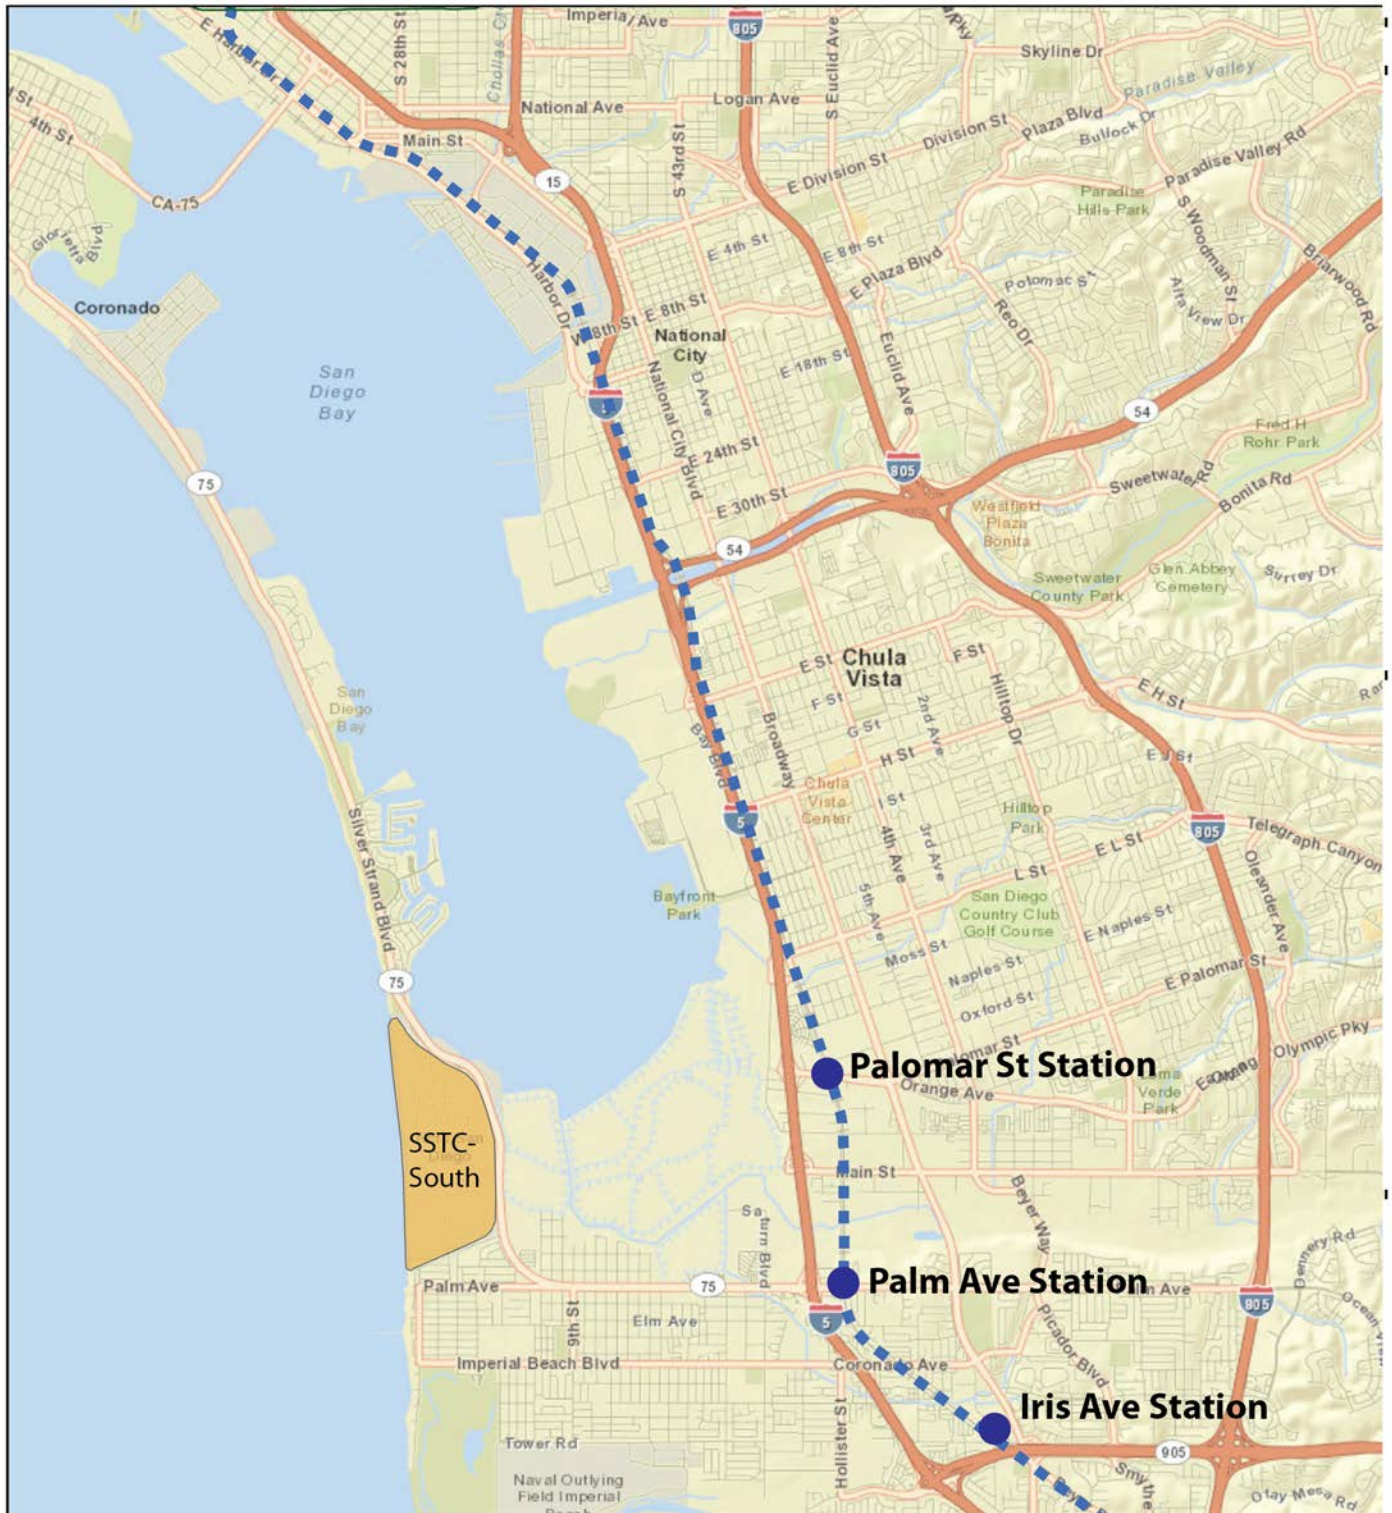

The Department of the Navy (DON) estimates that 1,400 to 1,500 civilian and military personnel commute to and from NASNI daily via MTS transit, the ferry, or a vanpool. This is approximately six-percent of the military personnel and DON civilian employees.

Figure 7-5 Blue Line Trolley Route

Source: MTS Route Map, dated July 18, 2013

Alternative Transportation Subsidy

The DON provides a transit subsidy program to help offset some of the costs for employees commuting with the use of mass transit and vanpools. The Transportation Incentive Program (TIP) outlines the details of the program. Each user of this program will receive up to \$110 per month in tax free assistance. In general, the six forms of public transportation eligible for TIP are the following:

- COASTER
- San Diego Trolley
- MTS Buses
- San Diego Bay Ferry
- Vanpool Services, Inc. (VPSI) Vanpool
- Ridesharing

According to the TIP, each vanpool must have at least six people (not including the driver) and be at least half filled on each trip in order to qualify for the subsidy program. At NASNI, the current vanpool program consists of groups of 7 to 14 riders together to and from NASNI in privately owned vans. These riders often come from areas outside the County of San Diego. Based on the latest estimates, 80 vanpools are operated with 762 members.

Bicycle Facilities

A Class I facility is a bike path that has its own right-of-way (ROW) and is exclusively used for bicyclists. A Class II facility is a bike lane that is used exclusively or semi-exclusively for bicyclists and is usually provided on an existing roadway and separated from through traffic by striping or other pavement markings. A Class III facility is a bike route that shares ROW designated by signs or pavement markings.

Creating bicycle facility connections to SSTC-South will be important with completion of the Proposed Action, regardless of the Alternative. Silver Strand Boulevard (SR-75) hosts one of San Diego's most extensive bicycle facilities, the Bayshore Bikeway. **Figure 7-6** illustrates the Bayshore Bikeway route, which includes paths through San Diego, National City, Chula Vista, Imperial Beach, and Coronado; utilizing the ferry to connect between Coronado and San Diego. With implementation of P947, the new signalized intersection along SR-75 serving a new ECP for SSTC-South along SR-75, the Proposed Action would be able to connect to the Bayshore Bikeway by providing a bicycle crossing at the new traffic signal. The new traffic signal would provide a designated and controlled place for bicyclists to cross Silver Strand Boulevard (SR-75) and access SSTC-South from Bayshore Bikeway. This connection provides a regional attractiveness to bicycling from users throughout the surrounding cities. The Bayshore Bikeway could also be used to travel from the Palomar Avenue Trolley station to SSTC-South. This ride is about five miles in length and could be made in less than 30 minutes. Secure bicycle lockers are available for a nominal fee at all trolley stations. Design of the new ECP at SR-75 should include bicycle presence detection so that the traffic signal can accommodate safe crossing of this high speed route.

If P947 was not completed, bicyclists would have to enter through the existing ECP in Imperial Beach and would be forced to traverse along Class II and III facilities to gain access to SSTC-South. The regional attraction of bicycling to access SSTC-South would not be nearly as attractive without P947 in place. There would remain some attraction for bicyclists that lived in Imperial Beach.

Bicyclist facilities in Coronado and around NBC facilities other than SSTC-South would not be affected by the Proposed Action.

Figure 7-6 Bayshore Bikeway Route

Source: SANDAG, July 2013

Internal to the NBC Coastal Campus, the compact development pattern does not require using passenger vehicles to get around the campus once the vehicle is initially parked. The campus is designed to be pedestrian- and bicycle-friendly, with parking around the perimeter and narrower streets with sidewalks and low volumes of vehicles in the central portions of campus. Providing this environment further encourages bicyclists to commute to and from work, as vehicles are not needed to get between facilities throughout the day. Further, a shared bicycle system internal to the campus could be established to allow people with further commutes to use bicycles once they arrive on campus.

Pedestrian Facilities

A walkability analysis was performed to determine the attractiveness of walking to the new NBC Coastal Campus from the surrounding communities. The location of SSTC-South and the setback of the NBC Coastal Campus from access points make commuting by walking unreasonable for most. The distance from a central point within the NBC Coastal Campus at SSTC-South to the security gate is about one-quarter of a mile. The security gate is another one-quarter mile from Silver Strand Boulevard (SR-75). It would be at least a two mile walk to reach the residential area to the north. The most attractive areas to see pedestrian traffic would be the northern portions of Imperial Beach near the existing ECP; however, between the ECP and the core of campus it is still over a mile walk, assuming the existing gate remains open. Although the Bayshore Bikeway provides great regional connectivity, SSTC-South is isolated enough where it would require multiple miles of walking to commute to and from the NBC Coastal Campus. Pedestrian commuting is not reasonable to assume, but pedestrian facilities internal to the site are vital to the design of the campus.

Internal to the NBC Coastal Campus, the environment encourages not using passenger car vehicles to get around the campus once the vehicle is initially parked. The campus is designed to be pedestrian- and bicycle-friendly, with parking around the perimeter and narrower streets with sidewalks and low volumes of vehicles in the central portions of campus. Care should be taken in the site design to separate heavy pedestrian corridors from truck routes and streets with higher traffic volumes. Providing this environment encourages pedestrian activity throughout the campus and it is essential that adequate facilities are provided.

On-Site Parking

Although transit and bicycle facilities provide alternative mode of travel options, it is still expected that over 90% of users to SSTC-South will be using a personal vehicle to commute every day. Thus, the design strives to provide adequate on-site parking to accommodate the vehicles. During the development of the Proposed Action, NSW representatives that would be using the new facilities provided input on the number of personnel and parking spaces that they expect they need. Input from various representatives as combined to estimate the vehicle demand and then parking lots were incorporated into the design of the campus as best as possible given the many constraints and limited space.

On-Site Circulation

The campus is designed to minimize the need for vehicles to circulate on-site. However, some of the operations require vehicles to access buildings throughout the campus and streets must be provided to accommodate these vehicles. Further, many of the vehicles that need to drive internal to the site are heavy vehicles that are wider and longer than the average passenger car and require more room to maneuver. The final design of the on-site circulation should take into consideration the largest vehicle that is expected to use the facilities and make sure the streets, driveways, and turns are able to accommodate that vehicle.

8.0 FINDINGS AND CONCLUSIONS

This traffic study has evaluated the traffic operations with the addition of the NBC Coastal Campus. Project Alternatives 1, 2, and 3 were each evaluated and compared to a baseline No-Action Alternative for Year 2024 and Year 2040 conditions with one, two, and three CVNs in port at NASNI to determine potential traffic impact locations. Additional analysis was performed to determine the traffic impacts if a new ECP was not implemented as part of the Proposed Action. Additional impacts were found with exclusion of P947, the new ECP MILCON project. Based on the findings of all the various analysis scenarios, potential improvements were identified.

It is recommended that improvements are implemented at seven of the twelve locations identified to have an impact. A total of nine locations would have an impact without construction of P947. One location has an impact only under Year 2040 with 2 CVN Conditions and no mitigation is recommended. One location has an impact that only occurs for Alternative 3 with 2 CVN Conditions and no mitigation is identified. The following paragraphs summarize the key findings and conclusions of the analyses.

Summary of Intersection Analyses

Table 8-1 has been prepared to summarize the locations at which impacts were found and during which scenarios those impacts were found to occur. As shown in the table, Alternatives 1 and 2 would have six impacts by Year 2024 and an additional two impacts by Year 2040. Alternative 3 would also have six impacts by Year 2024 and an additional two impacts by Year 2040, but with slightly different locations than Alternative 1.

Without P947, three additional impacts were determined for Alternatives 1, 2, and 3; all along Palm Avenue in the City of Imperial Beach.

Summary of Intersection Lane Vehicle Analyses

Table 8-2 has been prepared to summarize the ILV analysis results for the Palm Avenue and I-5 interchange. Both signalized intersections were found to be either below capacity (<1200) or approaching capacity (<1500) for all scenarios.

Potential Improvements

This study identified twelve improvements that could be made to the study area intersections to address inadequate operations with implementation of the NBC Coastal Campus. Eight of the improvements would apply to Alternatives 1, 2, or 3 as long as MILCON P947 is implemented. One of those eight improvements only occurs in Year 2040 with 2 CVNs and is not recommended for implementation as a result of this project. The four other improvements would only apply if P947 is not implemented.

The following seven improvements are recommended as mitigation measures for the NBC Coastal Campus. These improvements were developed with input from Caltrans. Prior to implementation, the proposed improvements should be confirmed with Caltrans and the respective City to ensure they are still necessary and are consistent with other planned improvements not known at the time of this study.

M7. Intersection #10, Silver Strand Boulevard (SR-75) & Tulagi Road

The significant impact at this intersection during the PM peak-hour can be mitigated by modifying the traffic signal timing by extending the green time on Silver Strand Boulevard (SR-75) by ten seconds to reflect a different traffic pattern that would be in place with the addition of the Proposed Action. The traffic signal is uncoordinated and the cycle length would be adjusted

to include this additional ten seconds. No changes to the existing right-of-way and pavement width would be required.

M8. Intersection #18, Silver Strand Boulevard (SR-75) & Rainbow Drive

The significant impact at this intersection during the AM peak-hour can be mitigated by modifying the lane configuration on the eastbound Rainbow Drive approach. Changing the existing through-right lane into a left-through-right lane and extending the existing turn pocket to the intersection of Bonito Avenue increases capacity and queue area for this approach. The extension of the turn pocket would result in a loss of two 2-hour limit parking spaces. No changes to the existing right-of-way and pavement width would be required.

M9. Intersection #26, 9th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by restriping the northbound and southbound approaches to have exclusive left-turn lanes and a shared through-right lane. The signal operations could then be changed from split phasing to protected left-turn phasing for these approaches. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By changing the phasing, it allows the northbound and southbound through movements and pedestrian crossings to occur simultaneously, ultimately reducing the amount of time needed for 9th Street and providing more green time for Palm Avenue (SR-75).

M10. Intersection #28, 13th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated by removing the pedestrian crossing on the east leg of the intersection and shortening the corresponding northbound split time. The intersection is currently split-phase for northbound and southbound movements and requires a significant amount of time for pedestrians to cross Palm Avenue twice: once with the southbound movements and once with the northbound movements. By providing just a single crosswalk, it allows more green time to be assigned to the heavy movements on Palm Avenue (SR-75).

M11. Intersection #30, Saturn Boulevard/19th Street & Palm Avenue (SR-75)

The significant impact at this intersection during the PM peak-hour can be mitigated with the addition of a second westbound left-turn lane. There is currently a single westbound left-turn lane adjacent to an eight-foot wide raised median. To fit in a second left-turn lane within the existing curb width, the median would need to be reduced to four-feet wide and the eastbound through lane widths would need to be narrowed slightly. The bike lane would operate similar to its current layout.

M12. Intersection #19, 7th Street and Silver Strand Boulevard (SR-75)

The significant impact at this intersection could be mitigated by striping the southbound approach to include a left-turn pocket and through-right lane. This would require removing some parking along 7th Street to make room for the additional lane, estimated to be two parking spaces.

M13. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact for Year 2040 at this intersection can be partially mitigated by extending the southbound right-turn storage pockets on the exit ramp. This would require widening of the ramp.

The following improvement is not recommended as mitigation measures for the NBC Coastal Campus. The City of Coronado has requested that this intersection is evaluated under separate environmental review at a later date to determine when, if, and what type of traffic control safety measures are necessary at this location.

M14. Intersection #11, Fidler's Cove Driveway and Silver Strand Boulevard (SR-75)

The impact at the intersection of Silver Strand Boulevard (SR-75) and Fiddler's Cove Driveway was only identified for Alternatives 1 and 2 when two CVNs are in port and is a result of cumulative traffic along Silver Strand Boulevard (SR-75) preventing gaps in traffic from occurring for vehicles attempting to turn left out of Fiddler's Cove driveway. It can be mitigated by restricting outbound left turns from the driveway.

For several reasons identified in this study, it is recommended that P947 is implemented as early as possible in the Proposed Action development. P947 is necessary to prevent traffic in Imperial Beach from becoming excessive and providing appropriate capacity and security facilities to process the increasing number of vehicles accessing SSTC-South. It is assumed that P947 is included in the Proposed Action and no additional mitigation measures are required; however, if P947 is not implemented, additional mitigation measures identified in this study would apply:

M10. Intersection #21, Silver Strand Boulevard and Palm Avenue

The significant impact at this intersection would require widening of Silver Strand Boulevard from two lanes to four lanes and installation of a traffic signal at the intersection. Even with these improvements the intersection would still operate at LOS E during the PM peak hour.

M11. Intersection #22, 3rd Street and Palm Avenue

The significant impact at this intersection during the AM and PM peak-hours can be mitigated with the installation of a traffic signal.

M12. Intersection #23, Palm Avenue and Rainbow Drive

The significant impact at this intersection during the AM and PM peak-hours can be mitigated by restricting southbound left-turn movements. Vehicles that want to head eastbound on Palm Avenue from Rainbow Drive could utilize the intersection of Rainbow Drive and Silver Strand Boulevard (SR-75), approximately 700 feet north of this intersection to head eastbound.

M11. Intersection #31, I-5 SB Exit Ramp and Palm Avenue (SR-75)

The significant impact for Year 2024 at this intersection during the PM peak-hour can be mitigated by adjusting the signal timing at the intersection. The length of the eastbound, westbound, and southbound signal splits would need to be increased by 5 seconds (for a total cycle increase of 10 seconds).

The following impact location was identified to not have reasonable or feasible mitigations for the NBC Coastal Campus:

The intersection of Orange Avenue (SR-75) and Fourth Street (SR-75) is considered an impact because it worsens an existing LOS F condition by more than 1 second. The increase in delay for the Alternative 3 scenario when two CVNs are in port is 1.1 seconds. There was no reasonable mitigation found for this location. This impact was identified for Alternative 3 scenarios with 2 CVNs in. It would be considered a significant and unavoidable impact for Alternative 3.

Implementation of Potential Improvements

Several improvements involve signal retiming or modifications along SR-75. It is suggested that the DON discuss the funding of improvements with Caltrans and other stakeholders to develop a joint funding approach. It is also suggested that the DON pursue funding opportunities for early implementation of MILCON project P947 to prevent traffic congestion in Imperial Beach and establish an ECP with adequate capacity and appropriate security requirements.

Table 8-1. Peak-Hour Intersection Analysis Impact Summary

Additional Impact Minimization Measures

In addition to the physical improvements noted in this study that mitigate potential traffic impacts, the Navy should also consider implementing the following impact minimization measures:

- Establish and implement measures to reduce construction traffic to the extent practicable.
- Work with Caltrans to establish appropriate traffic control management at the interim gate at the Hooper Boulevard entrance until the proposed Entry Control Point is fully constructed.
- Monitor traffic at the existing entrance to SSTC-South located in Imperial Beach and incorporate measures as necessary to maintain traffic volumes less than or equal to the existing volume.
- Commit to providing MTS bus stops at the new Entry Control Point intersection.
- Form an internal Traffic Advisory Committee to address traffic concerns.
- Prepare a Transportation Demand Management (TDM) Plan for Naval Base Coronado. This TDM Plan would consider the following topics:
 - Military Transportation Incentive Program (TIP)
 - SANDAG's iCommute program
 - Transit Network
 - Bicycle Network
 - Bikes sharing programs
 - Pedestrian
 - Carpool/Vanpool
 - Intra-Base shuttle system
 - Car sharing programs
 - Parking supply limitations
 - Parking fees
 - Ferry service
 - Entry Control Point staffing
 - Signal timings
 - Work hours
- Continue to implement the goals of the 2014 Memorandum of Agreement between the Navy and SANDAG to reduce drive-alone work trips.
- Continue to coordinate with SANDAG to understand and apply region-wide transportation demand management tools, such as the following SANDAG documents noted provided during the EIS comment period²:
 - Designing for Smart Growth, Creating Great Places in the San Diego Region
 - Planning and Designing for Pedestrians, Model Guidelines for the San Diego Region
 - Trip Generation for Smart Growth
 - Parking Strategies for Smart Growth
 - Regional Multimodal Transportation Analysis: Alternative Approaches for Preparing Multimodal Transportation Analysis in EIRs
 - Integrating Transportation Demand Management into the Planning and Development Process – A Reference for Cities
 - Riding to 2050, the San Diego Regional Bike Plan
 - Healthy Communities Atlas

Implementation of these measures would be beyond what is required of the Navy to mitigate their impacts but would further improve traffic conditions through Imperial Beach and Coronado and is encouraged.

APPENDICES

APPENDIX A

- Trends and Historical Data

Appendix A – Trends and Historical Data

The following section summarizes various traffic trends that have occurred over the past two decades. The trend analysis includes traffic volumes, intersection operations, truck traffic, bus and ferry ridership, and travel times. This data helps to show historical changes to travel patterns in the area and provide an understanding of the ongoing traffic issues.

Traffic Volumes

Historical traffic volumes at the following locations have been compiled from Caltrans data:

- SR-75 (San Diego-Coronado Bridge)
- SR-75 (Silver Strand Boulevard)
- Third Street/Fourth Street Couplet
- Orange Avenue between First Street and Pomona Avenue

At the time of this study the latest published data by Caltrans was the Year 2011 traffic data.

San Diego-Coronado Bridge

Figure A-1 illustrates the annual average daily traffic (AADT) volumes at post mile (PM) 20.284 along SR-75, which is the location of the toll booths at the west end of the San Diego-Coronado Bridge. With the removal of the toll in 2002, the data indicated a large increase in traffic volumes (76,000 in 2001 to 83,000 in 2002). Prior to the toll removal, the data indicated an average AADT of less than 80,000 daily vehicles. Following that initial surge in traffic volumes immediately following the toll removal, traffic volumes remained relatively constant in excess of 80,000 daily vehicles and growth in traffic has been nominal. It should be noted that the data provided by Caltrans represents the highest month of data collected during its respective year.

Figure A-2 illustrates the peak-hour volumes (for both directions) at PM 20.284 along SR-75. As shown in the figure, traffic volumes have remained generally constant at approximately 7,000 vehicles during the peak-hour, except in the years 1996, 1997, and 2002. However, it is unclear if the peak-hour data represents the a.m. peak or the p.m. peak and could vary from year to year. Data is collected on an hourly basis and the highest hour of traffic is selected for the peak-hour, disregarding the time of day. It could be concluded that the peak-hour traffic volumes are almost at or at its capacity at this location given the five lanes of traffic (three westbound and two eastbound during the morning peak and vice versa during the afternoon peak).

Figure A-3 illustrates the monthly AADT volumes at PM 22.261 along SR-75 (near I-5) along with the average of all months. Traffic data was obtained for the Year 2006. As shown in the figure, the average traffic volume for 2006 was approximately 73,600 vehicles. January resulted in the lowest daily traffic volumes with approximately 67,400 vehicles. July resulted in the highest daily traffic volumes with approximately 83,100 vehicles. Traffic volumes between the months of June and September were higher than the average. Although the data represents 2006, the monthly variation in traffic still applies today. The peaks in the summer account for tourism traffic and an increase in recreational activity trips.

Silver Strand Boulevard

Figure A-4 illustrates the AADT volumes at PM 13.973 along SR-75 or Silver Strand Boulevard, which is located near the Silver Strand State Park entrance. As shown in the figure, traffic volumes generally ranged between 23,000 and 25,000 AADT between 1992 and 2006 with an outlier in 2003. From 1992 to 1997, the traffic data indicated a decreasing trend in traffic volumes. From 1997 to 2003, traffic volumes generally experienced an increasing trend. From 2004 to present, the traffic data shows a steady decreasing trend in volumes. In general, the traffic volumes experienced on Silver Strand Boulevard are approximately one-fourth of the volumes experienced on the San Diego-Coronado Bridge.

Figure A-5 illustrates the peak-hour volumes (for both directions) at PM 13.973 along SR-75 or Silver Strand Boulevard, which is located near the Silver Strand State Park entrance. As shown in the figure, traffic volumes generally ranged between 2,300 and 3,200 vehicles during the peak period. Similar to the AADT data, the peak-hour traffic data indicates a decreasing trend in traffic volumes from 1992 to 1997, then an increase trend until 2003, and then a steady decline in traffic volumes from 2003 to 2011.

Figure A-6 illustrates the monthly AADT volumes at PM 10.990 along SR-75 (near Rainbow Boulevard, which is south of the Silver Strand State Park) along with the average of all months. Traffic data was obtained for the Year 2006. It should be noted that the traffic data was missing for the months of September and November. As shown in the figure, the average traffic volume for 2006 was approximately 19,700 vehicles. December resulted in the lowest daily traffic volumes with approximately 18,000 vehicles. July resulted in the highest daily traffic volumes with approximately 22,000 vehicles. Traffic volumes between the months of June and August were higher than the average. Although the data represents 2006, the monthly variation in traffic still applies today. The peaks in the summer account for tourism traffic and an increase in recreational activity trips.

Figure A-6 2006 Monthly Traffic Volumes – Silver Strand Boulevard

Source: Caltrans Traffic and Vehicle Data Systems Unit

SR-282 – Third Street/Fourth Street Couplet

Figure A-7 illustrates the averaged AADT volumes between PM 0.000 and 0.581 along SR-282, which represents portions of the Third Street/Fourth Street Couplet. Traffic data was averaged for four locations along the Third Street/Fourth Street couplet, which include E Avenue, H Avenue, J Avenue, and Alameda Boulevard. As shown in the figure, traffic volumes along Third Street and Fourth Street generally showed a decrease in traffic volumes from 1992 to 1995 and increasing traffic volumes from 2000 to 2010. Traffic volumes appear to have peaked in 2010 and declined in 2011. Traffic volumes on Third Street were higher than Fourth Street from 1995 until 2004, at which point volumes began to even out.

Figure A-7 Daily Traffic Volumes – Third and Fourth Streets

Source: Caltrans Traffic and Vehicle Data Systems Unit. Data represents peak month for each respective year.

Figure A-8 illustrates the peak-hour volumes between PM 0.000 and 0.581 along SR-282. As shown in the figure, traffic volumes along Third Street and Fourth Street generally trend a decrease in traffic volumes from 1992 to 2011. The peak hour volumes have fluctuated year-to-year over the past twenty years, especially on Third Street. Unlike the average daily traffic volumes along these segments, peak hour traffic volumes have stayed fairly consistent since 2006. The most recent data available shows traffic volumes along the Third Street/Fourth Street couplet during the peak period are approximately 2,000 vehicles.

Figure A-8 Peak-Hour Traffic Volumes – Third and Fourth Streets

Source: Caltrans Traffic and Vehicle Data Systems Unit. Data represents peak month for each respective year.

Orange Avenue

Figure A-9 illustrates the averaged AADT volumes between PM 18.470 and 19.696 along Orange Avenue. Traffic data was averaged for six locations along Orange Avenue, which include Third Street, Fourth Street, Sixth Street, Eighth Street, Ninth Street, Tenth Street, and Pomona Avenue. As shown in the figure, traffic volumes peaked in 2003 with approximately 32,000 daily vehicles before dropping back down to 26,500 in 2006. Volumes increased to a secondary peak of about 28,000 in 2008 and then decreased and leveled off at just under 26,000 vehicles in current years.

Historical Coronado Roadway Segment Data

Table A-1 summarizes the traffic counts performed in nine different traffic studies performed between 1986 and 2007 that included roadway segment counts at various locations throughout Coronado. As shown in the table, traffic has generally shown some small increases since 1995. It should be noted that roadway counts can vary depending on the exact location of the count, day of count, time of year, and variations in activity such as CVNs. Some key notes from the data are:

- Although limited data is available from 1986, it is shown that volumes on the San Diego-Coronado Bridge have increased significantly while volumes on Silver Strand Boulevard south of NAB have had more modest increases. This is consistent with the idea that removal of the tolls on the San Diego-Coronado Bridge, first eastbound in 1986 and then westbound in 2002, lead to a direct increase in traffic volumes.
- Volumes along Third Street, Fourth Street, and Orange Avenue have remained fairly constant over the past ten years. First Street and Second Street both had noticeable increases in traffic in the early 2000s.
- Alameda Boulevard had a reduction in traffic with the reconfiguration of the main entry control point at NASNI. It should be noted that the counts in the table represent varying CVNs in port which accounts for some of the discrepancy in volumes.

Historical Coronado Intersection Operations Data

Table A-2 summarizes the analyses performed in six different traffic studies conducted between 1995 and 2007 at several intersections within the City of Coronado. As shown in the table, intersection analyses have generally provided similar LOS for the studies conducted between 1995 and 2005. Many of the intersections reported at LOS E or F in 2005 were performing similarly in 1995 and 1997. Improvements to a few intersections along Alameda Boulevard were documented in 2007, as well as a decrease in operations at R.H. Dana place and Orange Avenue.

Like roadways segments, intersection turning movement counts can vary depending on the exact location of the count, day of count, and time of year. Also, the HCM methodology for intersection analysis was modified with the HCM update in 1997, changing to report a different kind of delay then before. There continues to be small updates to methodology with every updated version of the HCM.

Table A-2 Historical Data for Intersection LOS

INTERSECTION	PEAK HOUR	FIRST CVN EIS (1995) (a)	THIRD STREET GATE TIA (1997) (b)	SECOND CVN EIS (1999) (c)	TOLL REMOVAL EIS (2001) (d)	CITY-WIDE TRAFFIC STUDY (2005) (e)	CVN SEIS TRAFFIC STUDY (2007) (f)

	PM				F	E	F

Notes:
Bold values indicate intersections operating at LOS E or F.
NC = not calculable. Study reports that LOS is not calculable but the intersection should be operating acceptably.
(a) Taken from *Final Environmental Impact Statement for the Development of Facilities in San Diego/Coronado to Support the Homeporting of One NIMITZ Class Aircraft Carrier*, dated November 1995. Counts were collected in 1992 & 1993, with two CVN's in port.
(b) Taken from the *Final Traffic Impact Analysis NASNI Third Street Gate Coronado, California*, dated February 1997. Counts were collected August 1996, with two CVN's in port.
(c) Taken from the *Final Environment Impact Statement for Developing Home Port Facilities for Three NIMITZ-Class Aircraft Carriers in Support of the U.S. Pacific Fleet*, dated July 1999. Counts were calculated in 1998 using inputs from Caltrans, SANDAG, and the City of Coronado.
(d) Taken from the *Final Environmental Impact Report for the San Diego-Coronado Bridge Toll Removal*, dated October 2001. Counts were collected in 2000, with two CVN's in port.
(e) Taken from the *Coronado City-Wide Major Traffic Study*, dated March 2005. Counts were collected July - August 2003, with two CVN's in port.
(f) Taken from the *Supplemental Environmental Impact Statement for Developing Home Port Facilities for Three NIMITZ-Class Aircraft Carriers in Support of the U.S. Pacific Fleet*, dated May 2008. Counts were collected July 2007, with one CVN in port.

Blank cells indicate that intersections were not studied for the respective report.

NASNI Traffic

Table A-3 summarizes the historical trends for entering traffic at the NASNI gates from 1983 to 2007. A reconfiguration of the Main gate was performed between 2005 and 2007. As shown in the table, there are considerable variations in traffic entering NASNI in each respective year. For the traffic data between 1983 and 2005, the Main Gate at Fourth Street resulted in approximately 50 percent of the inbound traffic to NASNI. The First Street Gate resulted in approximately 25 percent of the inbound traffic and the Second Street and Ocean Boulevard Gates resulted in the remaining 25 percent of the inbound traffic. It should be noted that the data collected in 2002 had one, two, and three carriers in port. The increase in entering traffic with each additional carrier in port was approximately 2,350 ADT. Assuming that the exiting traffic was the same as the entering traffic, this resulted in 4,700 ADT ($2,350 \times 2$) for the total traffic entering and exiting NASNI, which correlates to the trip generation of a carrier in port. After the gate reconfiguration, traffic counts from 2007 indicate approximately 75 percent of the traffic enter NASNI at the Main Gate at Third Street. The First Street and Ocean Boulevard Gates resulted in the remaining 25 percent of the inbound traffic with the First Street Gate receiving a slightly higher amount of traffic. The traffic entering NASNI was approximately 20,000 ADT, which is generally consistent with the data collected in May 2002 with one carrier in port.

Table A-3 Historical Count Data for Entering Traffic at NASNI

GATE	INBOUND ADT											
	1983 (d)	Jul 1988 (d)	Feb 1989 (d)	Jan 1990 (d)	Jul 1993 (d)	Aug 1995 (d)	Feb 1999 (d)	May 2002 (a)	May 2002 (b)	Aug 2002 (c)	Nov 2005 (d)	Jul 2007 (a)
First St (Gate 2)	4,600	6,553	7,432	5,220	3,480	5,100	3,481	3,961	5,332	7,133	7,143	3,350

Total Inbound	25,800	27,502	30,989	17,664	15,958	19,122	22,568	19,131	21,481	23,848	21,192	20,008
<p>Notes:</p> <p>(a) Counts were performed with one carrier in port.</p> <p>(b) Counts were performed with two carriers in port.</p> <p>(c) Counts were performed with three carriers in port.</p> <p>(d) Counts were performed with an unknown amount of carriers in port.</p> <p>1983 counts taken from the <i>Traffic Engineering-Planning Study</i>, dated May, 1983.</p> <p>1988 through 1993 counts taken from the <i>Final Environmental Impact Statement for the Development of Facilities in San Diego/Coronado to Support the Homeporting of One NIMITZ Class Aircraft Carrier</i>, dated November 1995. Counts were provided by the NASNI Security Department in 1994.</p> <p>1995 and 1999 counts taken from NASNI information compiled in June 2000 and provided to Kimley-Horn and Associates in July 2007.</p> <p>2002 counts taken from NASNI studies associated with an Environmental Impact Statement Record of Decision, which indicated that traffic would be monitored with one, two, and three carriers in port.</p> <p>2005 counts taken from the Third Street Gate Signal Warrant Study. Counts were collected in November 2005.</p> <p>July 2007 counts taken between July 22, 2007 and July 28, 2007 by National Data & Surveying Services.</p>												

Travel Times between NASNI and San Diego-Coronado Bridge

Figure A-10 illustrates the average travel times between the San Diego-Coronado Bridge and the NASNI gates during the peak periods. Travel time runs during the morning and afternoon peak periods were conducted by Navy staff between the toll booths at the San Diego-Coronado Bridge and the entrance to NASNI. The travel times during the morning peak represent the time it takes a vehicle to get from the toll booth at the San Diego-Coronado Bridge to the NASNI gates. In the afternoon peak, the travel time represents the time a vehicle takes to get from the NASNI gate to the toll booth at the San Diego-Coronado Bridge. A minimum of seven travel time runs in each direction were made during the peak periods. Data was collected from June 5, 2007 to July 6, 2007 for the travel time runs with the entrance to NASNI located at Fourth Street, prior to the reconfiguration. Data was collected from July 10, 2007 to August 23, 2007 for the travel time runs with the modified entrance to NASNI at Third Street.

Figure A-10 Average Peak Period Travel Times

Source: Department of Navy

As shown in the figure, there was an immediate travel time savings with the new gate on Third Street. During the morning peak, a commuter would experience a travel time savings of 18 percent, equal to about one minute. During the afternoon peak, a commuter would experience a travel time savings of seven percent, or just under thirty seconds. The morning peak experiences the most benefits from the new gate configuration since inbound traffic no longer needs to use Alameda Boulevard to enter the base.

Figure A-11 illustrates the average travel times between the San Diego-Coronado Bridge and the NASNI gates during the peak periods in 30-minute increments. The same data collected for Figure B-10 was used in this analysis.

Figure A-11 Incremental Peak Period Travel Times

Source: Department of Navy

As shown in the figure, the peak travel times occurred around 6:30 a.m. for entering vehicles and around 2:30 p.m. for exiting vehicles. With the reconfigured gate, the travel times during the morning peak period decreased significantly. During the afternoon peak the travel times for certain time periods increase, but the average travel time during the entire peak period decreases.

Transit Ridership

Historical transit ridership for the following routes serving the City of Coronado has been compiled from MTS data and captures ridership from 1995 to 2010:

- Route 901: Provides regional service between the cities of Imperial Beach, Coronado, and San Diego. Service is provided to NASNI at a bus stop located near the Third Street/I Avenue intersection.
- Route 904: Provides local service between the Coronado Island Marriot Resort and the City Hall with stops at the Ferry Landing and Hotel del Coronado.

Figure A-12 illustrates the local transit ridership data for Route 904. As shown in the figure, the ridership level fluctuates on a yearly basis. Route 904 ridership generally increased from 1995 to 2000, with a large decline in ridership from the Year 2000 to 2001. Ridership experienced a moderate increase in 2004 and then a steady decline from 2004 to present. The daily ridership totals range between just under 100 to just over 400 riders.

Figure A-12 Local Transit Ridership, Route 904

Source: Caltrans Traffic and Vehicle Data Systems Unit. Data represents peak month for each respective year.

Figure A-13 illustrates the regional transit ridership data for Route 901. As shown in the figure, the ridership level fluctuates on a yearly basis. From 1995 to 1998 Route 901 ridership generally increased; from 2000 to 2006 ridership generally declined. Between 2006 and 2009 ridership experienced another general increase, but from 2009 to 2010 Route 901 ridership had a sharp decline. Currently, the average ridership is approximately 3,500 on a daily basis. The peak ridership occurred in 2000 with approximately 4,700 daily riders. The large decrease after the year 2000 could have been caused by the tolls being removed in 2002 and more civilians working at NASNI have decided to drive to/from work instead of riding transit. In addition, bus ridership could have decreased due to heightened security after the 9/11 tragedy. The moderate increase in transit ridership could correspond to the recent collapse in the economy, with the large decrease in ridership from 2009 to 2010 possibly reflecting early economic recovery and increased driving.

Figure A-13 Regional Transit Ridership, Route 901

Source: Caltrans Traffic and Vehicle Data Systems Unit. Data represents peak month for each respective year.

Figure A-14 illustrates historical boarding and alighting at the NASNI bus stop near the intersection of Fourth Street/Alameda Boulevard for Route 901. The data represents 1995 to 2006, when Route 901 dropped the Fourth Street and Alameda Boulevard stop in 2006. As shown in the figure, the number of boarding and alighting at the NASNI bus stop prior to 2001 ranged between 250 and 450 passengers per day. However, between 2001 and 2002, the number of boarding and alighting significantly decreased to approximately 50 passengers per day and remained at that level through 2006. The large decrease could have been caused by the tolls being removed in 2002 and more civilians working at NASNI has decided to drive and/or vanpool to/from work instead of riding transit.

Figure A-14 Route 901 Boarding and Alighting Near NASNI

Source: Caltrans Traffic and Vehicle Data Systems Unit. Data represents peak month for each respective year.

Ferry Ridership

Figure A-15 illustrates the historical daily ferry ridership to NASNI between the years 1998 to 2006. The name of the commuter ferry is Marietta and has a capacity of 525 passengers. As shown in the figure, the average ridership ranged from a low of approximately 125 passengers in 1999 to a high of approximately 250 passengers in 2004. Since 2004, the average daily ridership has decreased by approximately 20 percent. At its peak, the ferry still was only 50 percent full and could hold another 275 passengers. The ferry no longer provides direct access to NASNI but continues to provide access between Coronado and San Diego.

Figure A-15 Historical Daily Ferry Ridership

Source: Harbor Excursions, 2007

Figure A-16 illustrates the average daily ferry ridership to NASNI for each month in 2006. As shown in the figure, ridership was consistent throughout the year, with December being the only month significantly outside the average ridership. The daily average ranges from a low of 141 riders in December to a peak month average of 262 riders in August, with a yearly average of 212 riders per day.

Figure A-16 2006 Average Daily Ferry Ridership by Month

Source: Harbor Excursions, 2007

Population

The total population over the last 40 years in the City of Coronado was based on data provided by the US Census. **Figure A-17** illustrates the trends in population over the years. As shown in the figure, the population ranged from a low of 19,000 in 1980 to a high of 27,000 in 1990. In recent years, the population has seen a gradual decline, and was back to its low of 19,000 in 2010, the date of the last available Census report.

The future population over next 20 years in the City of Coronado was based on data provided by the US Census. **Figure A-18** illustrates the trends in for the future. As shown in the figure, the population is expected to increase to approximately 31,000 by the Year 2030. This would represent an increase of approximately 63 percent over the current population.

Season Comparison

Traffic counts obtained at the intersections and roadway segments in the study area in July 2007 were compared to data collected in September 2007. At the intersections analyzed, the September 2007 traffic data generally remained the same as July 2007 levels during the morning peak, but experienced approximately a 10 percent decrease during the afternoon peak. Along the roadway segments in the study area, the September 2007 traffic data was approximately 13 percent lower than the July 2007 traffic data. Overall, the volumes and analysis results were similar between September and July, but July 2007 would represent a more conservative analysis.

APPENDIX C

- CVN Traffic Forecast

Appendix C – CVN Traffic Forecast

The methodology for forecasting traffic during different CVN levels was extracted from the *Home Port Facilities for three Nimitz-Class Aircraft Carriers*¹ traffic study and is applicable in this study for scenarios analyzed where multiple CVNs are in port.

The daily trip generation for a CVN was primarily based on trip rates published in the *1999 FEIS* and subsequent studies conducted in 2002. The 2002 study identified traffic conditions at the NASNI gates with one, two, and three carriers in port. The difference in average daily traffic (ADT) between one and three carriers (47,158 ADT – 37,548 ADT) resulted in 9,610 ADT. This value was divided by 2 to determine the average ADT per carrier, which resulted in 4,805 ADT per carrier. With a population of 3,217 personnel for each CVN, this resulted in a trip rate of 1.49 trips per person. The *1999 FEIS* had used a similar, but slightly lower rate of 1.47 trips per person. The 2002 observed rate was used in this study as it more accurately reflects conditions at NASNI.

The peak-hour traffic for a carrier was estimated on the likely arrival and departure of workers assigned to a CVN. In general, the 3,217 personnel corresponding to a 100 percent manning level for a CVN was converted to a total of 1,392 vehicle trips during the peak periods.

Table A-1 summarizes the trip generation for the various CVNs in port, with and without staggered work hours. As shown in the table, three CVNs in port without staggered work hours would generate 14,279 daily trips, including 4,176 (3,795 in, 181 out) a.m. peak-hour trips and 4,176 (381 in, 3,795 out) p.m. peak-hour trips. With staggered work hours, three CVNs in port would generate the same 14,279 daily trips, including 1,679 (1,526 in, 153 out) a.m. peak-hour trips and 1,727 (157 in, 1,570 out). The Navy is required to have staggered work hours to minimize traffic impacts whenever three CVNs are in port. Staggering work hours has a dramatic reduction in the peak 1-hour period, but it extends peak-hour traffic to a 3-hour period.

¹ Final Traffic Study for the Supplemental Environmental Impact Statement for Developing Home Port Facilities for three NIMITZ-Class Aircraft Carriers in Support of the U.S. Pacific Fleet (May 2008).

TABLE A-1
TRIP GENERATION SUMMARY

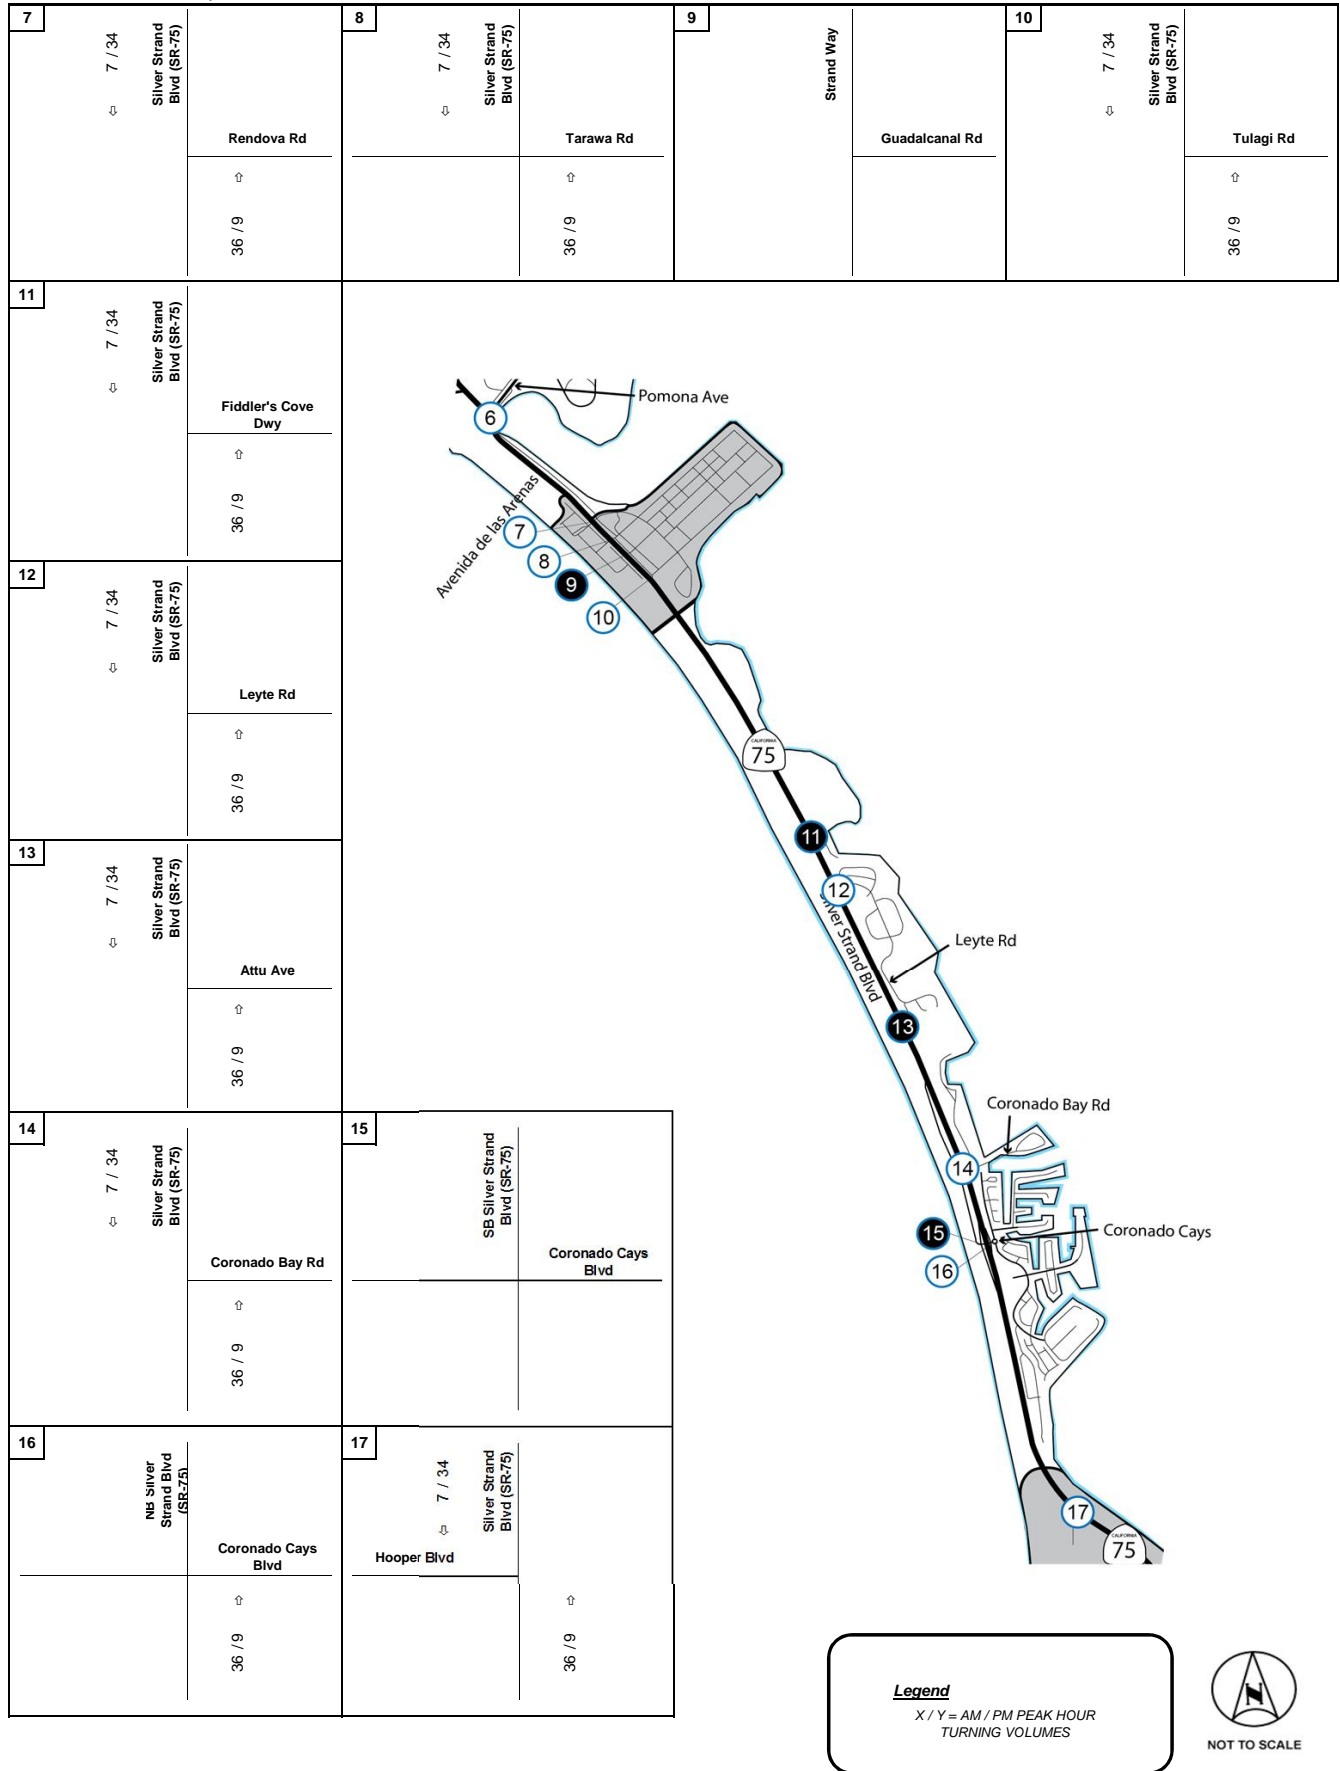

Land Use	Units	Trip Rate (a)	Daily Trips	AM Peak-Hour (b)	PM Peak-Hour (b)
1 CVN	3,217 Personnel	1.49/Personnel	4,793	1,392 (1,265 in, 127 out)	1,392 (127 in, 1,265 out)
2 CVNs	6,434 Personnel	1.49/Personnel	9,586	2,784 (2,530 in, 254 out)	2,784 (254 in, 2,530 out)
3 CVNs	9,651 Personnel	1.49/Personnel	14,379	4,176 (3,795 in, 381 out)	4,176 (381 in, 3,795 out)
3 CVNs (staggered work hours)	9,651 Personnel	1.49/Personnel	14,379	1,679 (1,526 in, 153 out)	1,727 (157 in, 1,570 out)
Note: (a) Trip rate primarily based on updated data contained in the September 4, 2002 Memorandum for the Record (Beaman 2002). (b) 29 percent of the daily trips occurred during both peak periods with a 90/10 split during the AM Peak-Hour and a 10/90 split during the PM Peak-Hour.

Total Volume Per Leg

ITM Peak Hour Summary

Prepared by:

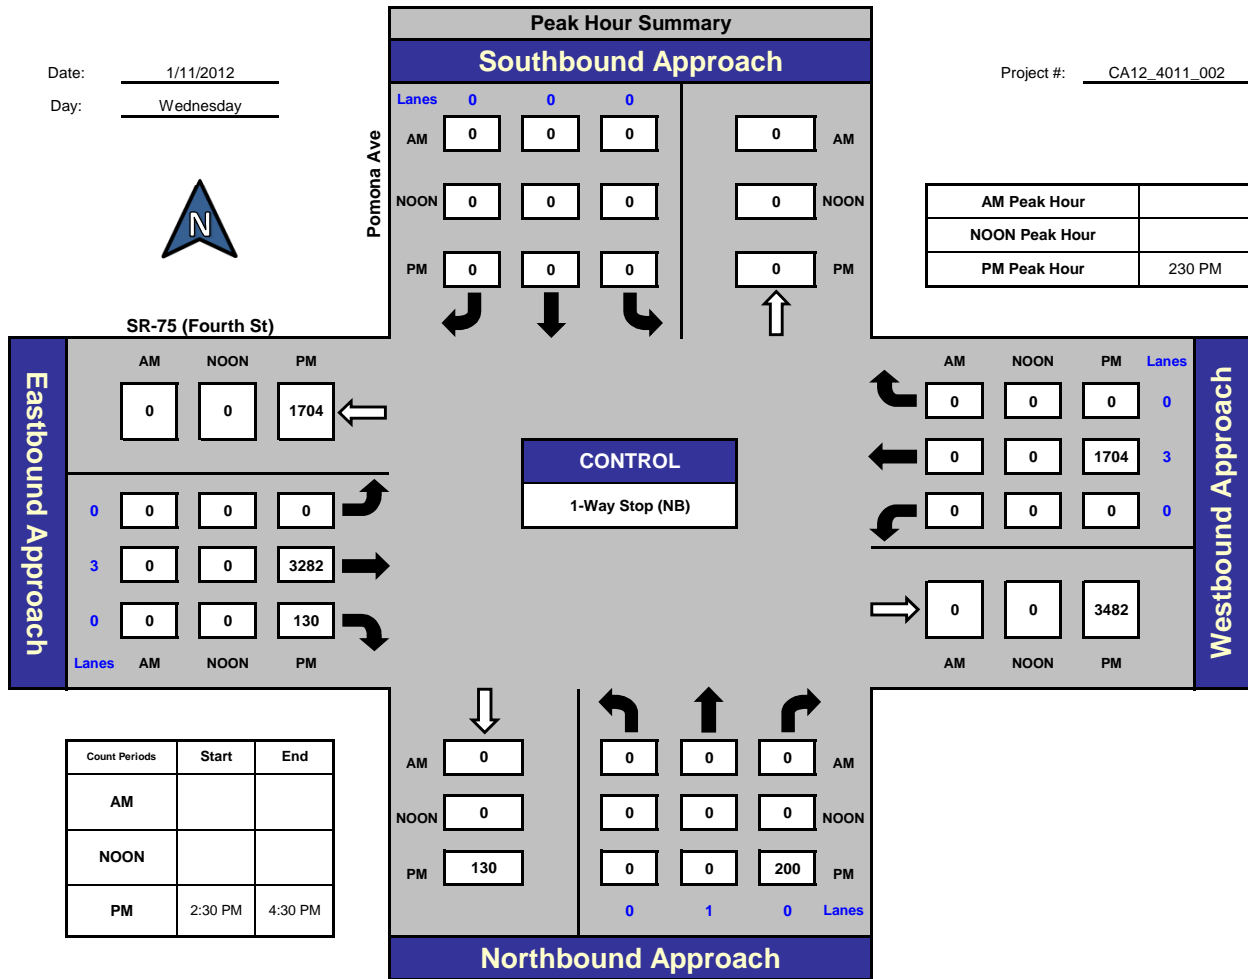

National Data & Surveying Services

I-5 SB Exit Ramp and SR-75 (Palm Ave) , City of Coronado

Date: 1/10/2012

Day: Tuesday

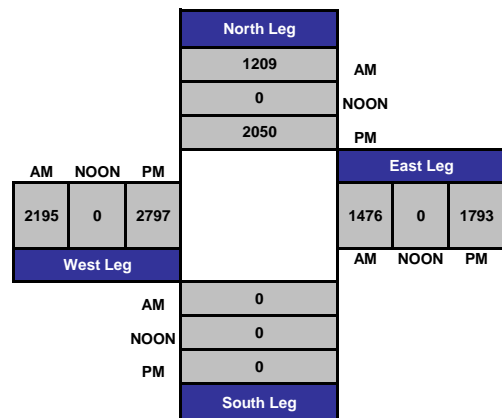

Project #: CA12_4011_031

Total Ins & Outs

Total Volume Per Leg

ITM Peak Hour Summary

Prepared by:

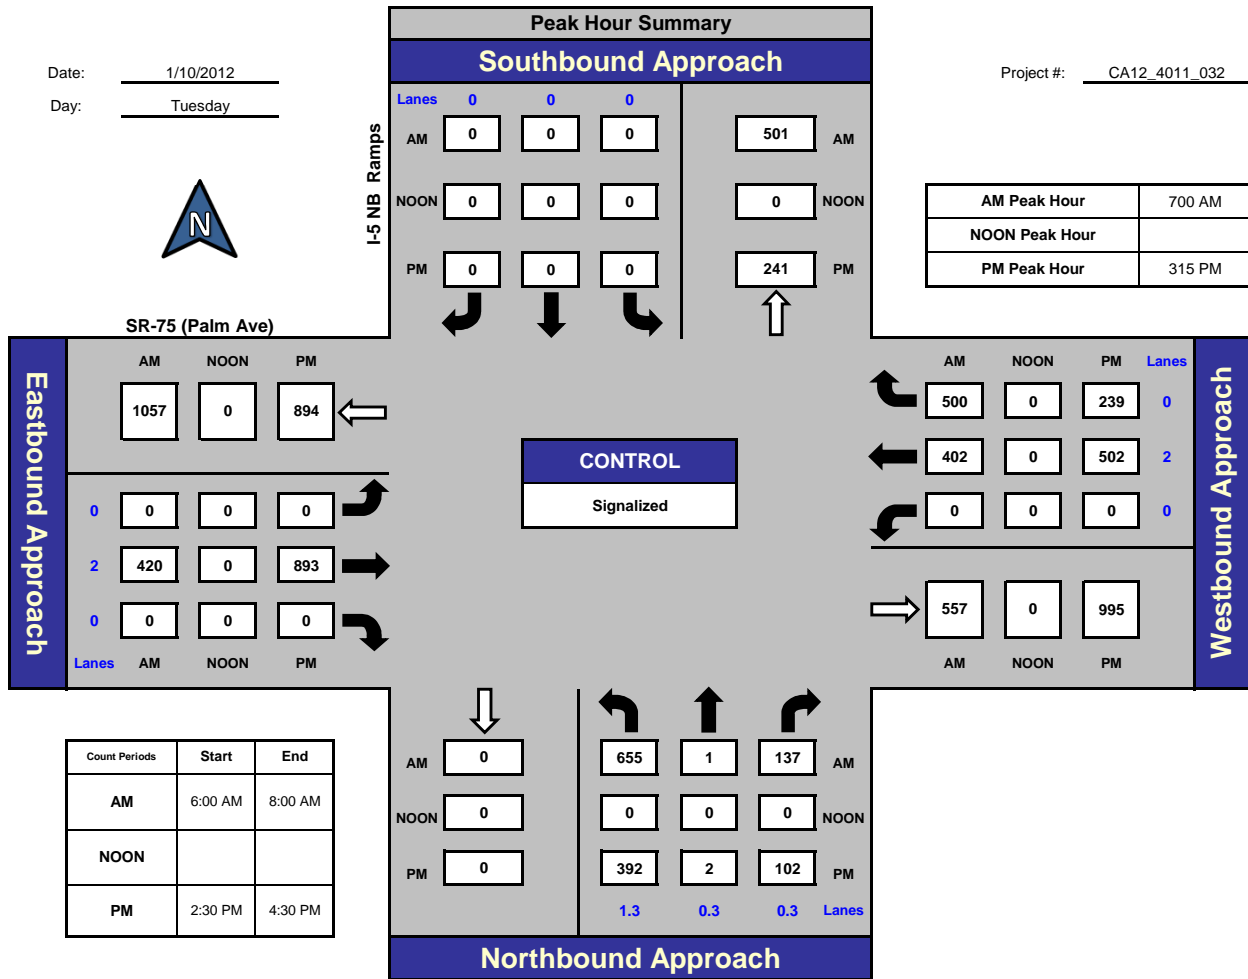

National Data & Surveying Services

I-5 NB Ramps and SR-75 (Palm Ave), City of Coronado

Date: 1/10/2012
Day: Tuesday

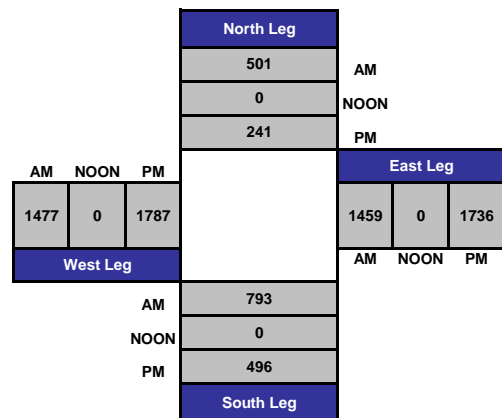

Project #: CA12_4011_032

Total Ins & Outs

Total Volume Per Leg

Kimley-Horn
and Associates, Inc.

Project Name: SSTC
Project Number: 95381020
Date: 8/8/2012

Initials: CHS
Time: 6:00 AM
Weather: Cloudy

Time	East Leg			West Leg			North Leg			South Leg			Observations
	EBL	EBT	EBR	WBL	WBT	WBR	NBL	NBT	NBR	SBL	SBT	SBR	
6:00 to 6:15			0				2	4			2		
6:15 to 6:30			0				0	3			1		
6:30 to 6:45			0				0	8			8		1 NBR ped (to house)
6:45 to 7:00			0				0	14			1		1 NB U-turn bicyclist
7:00 to 7:15			0				2	21			2		
7:15 to 7:30			3				2	22			2		
7:30 to 7:45			3				4	6			3		3 NBL peds
7:45 to 8:00			2				3	9			1		1 NB U-turn vehicle; 1 NBT bicyclist (not counted in tally); 2 EBR peds

Kimley-Horn
and Associates, Inc.

Project Name: SSTC Initials: CHS
