Minor Approach Volume:	154			
Minor Approach Volume Threshold:	203			

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future. Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction. Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

To: Caltrans

From: Mychal Loomis, P.E.

Date: September 17, 2013

Subject: Hooper Boulevard and Silver Strand Boulevard (SR-75) Signal
Warrant Analysis for Built Year (2024) Conditions

Per your request, a comprehensive signal warrant analysis was conducted for the intersection of Hooper Boulevard and Silver Strand Boulevard (SR-75). This intersection is currently a stop-controlled intersection, with Hooper Boulevard forced to stop and Silver Strand Boulevard running freely. Hooper Boulevard is currently closed to all traffic, however, curb cuts and turn lanes are provided on the Silver Strand Boulevard approaches. For the analysis year of 2024, the proposed design reopens Hooper Boulevard with two lanes in each direction. Additionally, modifications were made to the major street approaches. The Silver Strand Boulevard northbound approach has a total of three lanes; one left-turn only and two through lanes. The Silver Strand Boulevard southbound approach has a total of four lanes; one left-turn only, one right-turn only, and two through lanes. This signal warrant analysis was prepared using projected 2024 conditions near term with one Carrier Vessel Nuclear in port for two alternatives and methodology from the 2012 Manual on Uniform Traffic Control Devices California Edition (CA-MUTCD).

Signal Warrant Analysis

Chapter 4C of the CA-MUTCD, *Traffic Control Signal Needs Studies*, lists ten warrants for the installation of a traffic signal at an intersection. Generally, when an intersection meets one or more of the above signal warrants, it should be considered for signalization. A brief summary of each of the ten warrants is provided with the corresponding calculations for the intersection of Hooper Boulevard and Silver Strand Boulevard warrant analysis, when applicable.

Warrant 1, Eight-Hour Vehicular Volumes. Analyzes whether the minimum traffic volumes are met for each of any eight hour period during an average day. Eight hours of vehicle data was not available; therefore, **this warrant could not be conducted.**

Warrant 2, Four-Hour Vehicular Volumes. Analyzes whether the minimum traffic volumes are met for each of any four hour period during an average day. Four hours of vehicle data was not available; therefore, **this warrant could not be conducted.**

Warrant 3, Peak-Hour. Analyzes whether the minor street approach experiences undue delay in crossing or entering the major approach of any one hour period on an average day. This warrant was conducted for the 2024 conditions scenario for Alternative 1 and Alternative 3.

This warrant has two parts, and if either one of the parts is met then the warrant is met. The highest peak hour volume occurred in the afternoon. During this time, the collective approach volume (NB and SB) on Silver Strand Boulevard (major street) was 2094 vehicles for Alternative 1 and 2101 vehicles for Alternative 2. Additionally, the approach volume on Hooper Boulevard (minor street) was 647 vehicles for Alternative 1 and 540 vehicles for Alternative 2.

For Part A, all three conditions below must exist for the same one hour period of an average day. For both alternatives; the total delay, minor street volume, and total entering volume exceeds the given minimums for a two-lane minor street approach and an intersection with three approaches. Thus, **Part A of this warrant was met for both alternatives and therefor the warrant is met as a whole.**

Conditions:	1.The total delay experienced by traffic on the minor street approach exceeds 5 vehicle-hours (v-h)	2.The volume on the same minor street approach equals or exceeds 150 vehicles per hour (vph)	3.The total entering volume serviced during the hour equals or exceeds 650 vph
Alternative 1	229 v-h	647 vph	2741 vph
Alternative 3	189 v-h	540 vph	2641 vph

The total delay on the Hooper Boulevard approach was calculated by taking the eastbound approach delay and multiplying it by the total number of eastbound left-turning vehicles. For Alternative 1, the eastbound approach delay was 3654.3 seconds and the total delay was 229.41 v-h (226 vehicles x 3654.3 seconds x 1/3600 seconds per hour). For Alternative 3, the eastbound approach delay was 3606.7 seconds and the total delay was 189.35 v-h (189 vehicles x 3606.7 seconds x 1/3600 seconds per hour).

For Part B, the plotted point must fall above the applicable curve in Figure 4C-3 for the combination of approach lanes. For both alternatives, the plotted point representing the volume of both approaches on Silver Strand Boulevard and the volume on Hooper Boulevard for 1 hour for an average day falls above the “2 or more lanes & 2 or more lanes” curve. Thus, **Part B of this warrant was met for both alternatives and therefore the warrant is met as a whole.**

	X	Y
Alternative 1	2094	647
Alternative 3	2101	540

Warrant 4, Pedestrian Volumes. Analyzes whether pedestrians experience excessive delay in crossing the major street due to heavy traffic volumes. Pedestrian volume data was not available; therefore, **this warrant could not be conducted.**

Warrant 5, School Crossing. Determines whether school children crossing of the major roadway would warrant signal installation. Special California criterion is provided for this warrant in the CA-MUTCD. This warrant did not apply to this intersection since there is not a school located at or near this intersection. Therefore, **this warrant was not conducted.**

Warrant 6, Coordinated Signal System. Under special conditions, a traffic signal may be considered when the major street is operated with a coordinated signal system. This warrant should not be applied where the resultant spacing of traffic control signals would be less than 1,000 feet. This warrant did not apply to this intersection therefore, **this warrant was not conducted.**

Warrant 7, Crash Experience. Frequency and severity of accidents may justify the installation of a traffic signal. Crash data was not available; therefore, **this warrant could not be conducted.**

Warrant 8, Roadway Network. Under special conditions, a traffic signal may be considered at the intersection of two major through routes or regionally significant roadways. The intersection does not consist of two major through routes; therefore, **this warrant could not be conducted.**

Warrant 9, Intersection Near a Grade Crossing. A traffic signal may be considered if the proximity to the intersection of a grade crossing is the principal reason to consider installing a traffic signal and none of the conditions described in the other eight traffic signal warrants are met. There is not a grade crossing in proximity to the intersection which would justify a reason to consider a traffic signal. Therefore, **this warrant was not conducted.**

California Special Warrant, Bicycle Signal Warrant. Analyzes whether bicycle volumes or collisions are considerable or special geometrics apply. The geometric warrant did not apply to this intersection and bicycle data was not available; therefore, **this warrant could not be conducted.**

Summary and Recommendations

The intersection of Hooper Boulevard and Silver Strand Boulevard (SR-75) was evaluated for a traffic signal control using CA-MUTCD Warrants 3 because the data required for analysis of the other warrants was not readily available or the warrant did not apply to this intersection. All criteria for Warrant 3 were met. A traffic signal should be considered at this intersection based on the projected volumes and the warrants performed in this analysis.

Figure 4C-101 (CA). Traffic Signal Warrants Worksheet (Sheet 2 of 5)

WARRANT 2 - Four Hour Vehicular Volume

SATISFIED* YES ☐ NO ☐

Record hourly vehicular volumes for any four hours of an average day.

Notes:

There are 25 MILCON projects, existing traffic, and xxxxxx CATEx projects

It is assumed that construction of MILCONs would start the year after gaining funding. For example, FY2012 projects begin in 2013.

It is assumed that construction of each MILCON would last two years.

Existing peak-hour trip data was collected in October 2012.

Trucks: Average of 1 truck per day per 10,000 square feet and 2 trips per truck (one inbound, one outbound)

Workers: 1 worker per 750 sq. ft (SF < 25,000), 1 worker per 1000 sq. ft (25,000 ≤ SF < 75,000), 1 worker per 1,500 sq. ft (75,000 ≤ SF < 150,000)

Construction Daily Trips = [# of Trucks * passenger car equivalent factor (2.5) * # of trips per truck (2)] + [# of Workers * # of trips per worker (3)]

Construction Peak-Hour Trips = [# of workers + 0.25 * # of trucks] . All construction peak-hour trips are inbound in the morning and outbound in the afternoon.

Operational Daily Trips = [# of personnel * SANDAG Daily Trip Rate (2.5)]

Operational Peak-Hour Trips = [# of daily trips * SANDAG Trip Rate (9% in the morning with a 90% in/10% out split; 10% in the afternoon with a 20% in/80% out split)]

Notes:

There are 25 MILCON projects, existing traffic, and xxxxxx CATEX projects

It is assumed that construction of MILCONs would start the year after gaining funding. For example, FY2012 projects begin in 2013.

It is assumed that construction of each MILCON would last two years.

Existing peak-hour trip data was collected in October 2012.

Trucks: Average of 1 truck per day per 10,000 square feet and 2 trips per truck (one inbound, one outbound)

Workers: 1 worker per 750 sq. ft (SF < 25,000), 1 worker per 1000 sq. ft (25,000 ≤ SF < 75,000), 1 worker per 1,500 sq. ft (75,000 ≤ SF < 150,000)

Construction Daily Trips = [# of Trucks * passenger car equivalent factor (2.5) * # of trips per truck (2)] + [# of Workers * # of trips per worker (3)]

Construction Peak-Hour Trips = [# of workers + 0.25 * # of trucks] . All construction peak-hour trips are inbound in the morning and outbound in the afternoon.

Operational Daily Trips = [# of personnel * SANDAG Daily Trip Rate (2.5)]

Operational Peak-Hour Trips = [# of daily trips * SANDAG Trip Rate (9% in the morning with a 90% in/10% out split; 10% in the afternoon with a 20% in/80%out split)]
