AGENCY CONSULTATIONS

**E1 – U.S. FISH & WILDLIFE
INFORMAL CONSULTATION DETERMINATION**

United States Department of the Interior

FISH AND WILDLIFE SERVICE

Ecological Services
Carlsbad Fish and Wildlife Office
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

In Reply Refer To:
FWS-SDG-14B0200-14I0295

SEP 12 2014

Captain C. E. Sund
Commanding Officer
Naval Base Coronado
P.O. Box 357033
San Diego, California 92135-7033

Attention: Tiffany Shepherd

Subject: Informal Section 7 Consultation on the Coastal Campus Project at Silver Strand Training Complex South, Naval Base Coronado, San Diego County, California

Dear Captain Sund:

This is in response to your April 23, 2014, letter requesting consultation pursuant to section 7 of the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*) regarding the possible effects of the proposed Coastal Campus project (project) on the federally endangered salt marsh bird's beak (*Chloropyron maritimum* ssp. *maritimum*, bird's beak), San Diego fairy shrimp (*Branchinecta sandiegonensis*, fairy shrimp), light-footed clapper rail (*Rallus longirostris levipes*), rail¹; and threatened western snowy plover (*Charadrius nivosus nivosus*, plover) and its designated critical habitat. Based upon review of the information you provided and discussions with your staff, we determined that an informal consultation would satisfy the interagency consultation requirements of section 7 of the Act. This determination is based on the site and species information described below and the U.S. Department of the Navy's (Navy) commitment to implement specific conservation measures (Enclosure).

The project will be constructed on the Silver Strand Training Complex South (SSTC-South) bordered by the City of Coronado to the north, the City of Imperial Beach to the south, State Route (SR) 75 and San Diego Bay to the east, and the Pacific Ocean to the west (Figure 1). The purpose of the project is to provide adequate training facilities to: (1) support mandated force growth for Naval Special Warfare Command (NSWC) on the west coast and (2) maintain the required levels of operational readiness of special warfare forces. The project will consolidate NSWC training facilities to one location on SSTC-South.

¹ Please note that the American Ornithologists' Union now recognizes the clapper rail as the light-footed Ridgway's rail (*Rallus obsoletus levipes*) (Chesser et al. 2014).

Figure 1. Location of Coastal Campus project in San Diego County, California.

DESCRIPTION OF THE PROPOSED ACTION

The project will include construction of buildings, training facilities and associated infrastructure (i.e., fencing, utilities, storm water systems, roads, walkways, and parking lots) (Figure 1). With the exception of 120-foot tall parachute drying tower (paraloft), the height of all buildings will be limited to 45 feet. The paraloft will be located nearly 1,100 feet east of beach habitat on SSTC-South. Prior to the initiation of construction, geotechnical borings may be conducted within the project footprint. A detailed description of each project component is provided in the Biological Assessment (BA) for the project (Navy 2014).

Project construction will include demolition of an existing military bunker, Building 99, and up to 20 other existing structures (Figure 2). Demolition will be done with small commercial explosives (Building 99 only), diamond saws, excavators and/or hydraulic pavement breakers (e.g., hoe-rams). Demolished concrete and steel will either be reused for project construction or removed to a local landfill. Demolition debris will be stockpiled adjacent to the demolition site until it is reused or removed.

New utilities and improvements to existing utilities (water, wastewater, electrical, and natural gas) will also be constructed to serve the Coastal Campus. The Navy is proposing two options for constructing a new water line to connect to an existing water line (Figure 2). Under Option 1, a new 16-inch diameter water line will be constructed just east of the SSTC-South beach for about 9,876 feet from near the northern SSTC-South boundary to the southern boundary of the YMCA Camp Surf then extend east to connect back to the existing water line. Option 2 will follow Option 1 to about the midpoint of SSTC-South then extend east through the project footprint to connect with the existing water line. Replaced portions of the existing waterline will be abandoned in place. For both options, water line construction along the western SSTC-South boundary will occur inside of the perimeter fence within a 30-foot utility easement. No new construction is being proposed along the portion of the existing water line extending from the Coastal Campus footprint to the southern SSTC-South boundary.

Primary access to the project site during construction and operation will be from SR-75. The existing northern access road will be realigned and widened up to 72 feet, including additional turn lanes and improved ingress and egress from and to SR-75 in California Department of Transportation (Caltrans) right-of-way (ROW). In addition, the existing northern access gate (currently gated and locked, allowing for limited authorized access only) will be improved, including a 600-square foot sentry house and permanent visual and noise barriers, to serve as the new entry control point (P-947) (Figure 2).

Project construction is expected to begin in 2015 and be completed by 2024, with about 10 percent construction occurring each year. Upon project completion, 3,045 additional personnel are anticipated to relocate from Naval Amphibious Base (NAB) Coronado to SSTC-South, increasing the total number of personnel currently onsite from approximately 300 to about 3,300.

Figure 5-1
Proposed Action Area Effects

Figure 2. Coastal Campus project footprint.

During operation of the Coastal Campus, all training will be confined to buildings and training facilities constructed as part of the project. Maintenance will be conducted regularly on the buildings, training facilities, and the associated infrastructure (i.e., gates, fencing, roads, walkways, parking facilities, storm water facilities, and landscaped areas) in the Coastal Campus footprint. Routine maintenance within the existing and proposed utility easements (water, wastewater, and natural gas) will include regular vegetation trimming and mowing. Any replacement of vegetation associated with maintenance will not include the use of nonnative invasive plant species.

All maintenance activities, including staging areas for vehicle and equipment parking, vehicle refueling, materials storage, and general personnel support will be conducted within established roads (paved and unpaved) in the Coastal Campus footprint and utility easements. In addition, vehicles/equipment will be transported to the site using established roads. Therefore, routine maintenance is not anticipated to result in additional impacts beyond those anticipated during construction activities.

The project has a goal of zero storm water discharge (capture 100 percent of the discharge). However, if this goal cannot be achieved, runoff during construction and operation will be minimized and treated site design and/or structural BMPs.

ENVIRONMENTAL BASELINE/EFFECTS OF THE ACTION

Most of the project site consists of disturbed habitat and urban/developed area with existing buildings, training facilities and a radar array which are surrounded by a fence (Table 1, Figure 2). With the exception of the access/traffic improvements along SR-75, construction, operation, and maintenance of the project will stay within the existing perimeter fence, and permanently impact about 114.81 acres of vegetation and temporarily impact about 2.05 acres or 4.89 acres of vegetation depending on the chosen water line option. No federally listed species, and only 0.15 acre of plover critical habitat, occur in the project impact footprint. However, bird's beak, fairy shrimp, rails and plovers occur adjacent to the project impact footprint as described below (Figure 2).

Table 1. Temporary and permanent direct impacts (acres) from the Coastal Campus project.

¹ Includes 0.15 acre of plover critical habitat.

Bird's Beak

Although project-specific surveys were not conducted, bird's beak was observed in 2012 in an area of a known historical occurrence at the YMCA Camp Surf, immediately south of the project footprint (Figure 2). While potential habitat for this species occurs on SSTC-South, none of it occurs in the project footprint. Water line Option 1 will be constructed inside of the existing fence and pass through the back side of southern foredunes, approximately 100 feet west of the know bird's beak locations. The water line footprint is periodically disturbed by vehicles and does not contain suitable bird's beak habitat.

Although no direct impacts are expected, increased dust, runoff, erosion, sedimentation, and introduction of new invasive plant species from construction and maintenance of water line Option 1 could indirectly impact bird's beak. To minimize indirect impacts to the bird's beak during construction and maintenance of water line Option 1, the Navy will implement conservation measures including: ensuring a project biologist familiar with the species is onsite during construction activities to ensure compliance with all avoidance and minimization measures; ensuring all construction personnel receive environmental training before commencing work; implementing standard best management practices (BMPs) to minimize runoff, erosion, and sedimentation from the project footprint into the species' occupied habitat; washing and cleaning all equipment and vehicles prior to entering the project footprint to prevent the introduction of new invasive plants; and restoring temporary impact areas.

Fairy Shrimp

The southern half of SSTC-South supports 59 vernal pools, road ruts, drainage channels, and other features that pond water (referred to collectively as basins) (Figure 2). Fairy shrimp were detected in 29 basins on SSTC-South during surveys in 2010/2011. However, none of these fairy shrimp-occupied basins are within the project footprint.

Water line Option 2 includes maintenance of an existing water line that is immediately adjacent to a vernal pool, and crosses a drainage ditch, occupied by fairy shrimp. However, no maintenance of the existing water line will occur in the vernal pool (or its watershed) or drainage ditch as part of the project. If maintenance is necessary in the vernal pool (or its watershed) or drainage ditch, the Navy will reinitiate consultation to address any potential impacts to fairy shrimp.

Although no direct impacts are expected, increased dust, runoff, erosion, sedimentation, and introduction of new invasive plant species from project construction and maintenance of water line Option 2 could indirectly impact fairy shrimp. To minimize indirect impacts to fairy shrimp during construction, the Navy will implement conservation measures including ensuring a project biologist familiar with the species is onsite during construction to ensure compliance with all conservation measures; installing fencing around the outer perimeter of the project limits to reduce human disturbance, as needed; ensuring all construction personnel receive environmental training before commencing work; implementing BMPs to minimize runoff,

erosion, and sedimentation from the project footprint into the vernal pool watersheds; washing and cleaning all equipment and vehicles prior to entering the project footprint to prevent the introduction of new invasive plants; and restoring areas temporarily impacted by construction and maintenance to minimize the spread of invasive plants and prevent blowing dust.

All construction, including staging areas for vehicle and equipment parking, vehicle refueling, materials storage, and general personnel support will be conducted within the project footprint as identified and outside of the vernal pool watersheds. All maintenance activities, including staging areas for vehicle and equipment parking, vehicle refueling, materials storage, and general personnel support will be conducted within established roads (paved and unpaved) in the Coastal Campus footprint and utility easements but outside of the vernal pool watersheds and will not result in additional ground disturbance beyond the areas disturbed during construction.

While maintenance (i.e., vegetation trimming and mowing) will not result in additional ground disturbance, maintenance along the existing and proposed utilities easements could result in the introduction of new invasive plant species into adjacent fairy shrimp habitat. However, this impact will be minimized since maintenance personnel will receive environmental training before commencing work and all maintenance equipment and vehicles will be washed and cleaned prior to entering SSTC-South.

In addition, to avoid and minimize impacts to vernal pools and their watersheds resulting from unauthorized trespass during construction, operation, and maintenance, the Navy will install permanent signs and/or gates at all locations that could provide access (i.e., dirt access roads or foot paths) to the vernal pool watersheds prior to the initiation of construction and maintain signs and/or gates for the life of the project.

Plover

Although not known or expected to occur on the project site, plovers are known to nest on the SSTC-South beach west of the project site (Figure 2). Based on surveys from 2011 to 2013, there has been an average of six breeding pairs of plovers, and 20 nests and 13 fledges, per nesting season on the SSTC-South beach. From 2011 to 2013, the closest nest was approximately 310 feet to the west of the project footprint; however, nests generally occur about 450 feet west of the project footprint.

Although no direct impacts are expected, increased human disturbance (i.e., noise, lighting, and unauthorized trespass) and predation associated with project construction, operation, and maintenance could indirectly impact plovers. Loud, irregular sounds during project construction may cause plovers to spend more time away from their nests, thereby increasing the potential for eggs to cool and for eggs and chicks to be predated. Artificial lighting during project construction and operation may cause disorientation, startling, disruption of inter-specific interactions, and increased predation of plovers (Longcore and Rich 2004). However, southern foredunes between the project footprint and plover nesting areas along the western fence line are about 6 to 12 feet higher than the plover nesting area and are expected to attenuate much of the noise and light from

project construction, operation and maintenance. In addition, project construction, operation and maintenance noise levels reaching the nesting areas are expected to be similar to or less than the relatively high ambient noise levels from ocean surf.

To minimize impacts to plovers, construction within 300 feet of plover nesting areas will be avoided during the nesting season to the maximum extent feasible. Where the nesting season cannot be avoided, NBC Natural Resources Office (NRO), in coordination with the Service, will determine the locations to construct noise and visual attenuation barriers to mitigate any potential temporary noise and visual effects to nesting plovers. In addition, temporary construction and permanent outdoor lighting will be shielded and directed away from plover nesting areas.

Project construction and operation could also provide additional perching habitat (i.e., towers, tall buildings, utility poles, trees, fences) for avian predators (e.g., hawks, falcons, and ravens and crows), which may lead to increased plover predation. To minimize the availability of perching habitat during construction, the Navy will stage and store construction equipment that may allow for perching at least 500 feet away from plover nesting areas when not in use. To minimize the availability of perching habitat during operation, the Navy will: install anti-perching materials on light poles, rooftops, and other perching locations; locate the 120-foot-tall parachute drying tower about 1,100 feet east of plover nesting areas; ensure no net increase in the number of trees on SSTC-South (trees removed during construction will be replaced at the same ratio with native trees); trim and prune tree branches to open up the canopy of the trees to prevent avian predator nesting; space trees to prevent touching when full grown; place trees as far back from beach habitat as possible; and coordinate landscaping with NBC NRO to reduce the potential for use by avian predators.

Project construction and operation could also increase populations of mammalian and avian predators at SSTC-South by providing supplemental food (through trash). However, these impacts will be minimized by ensuring that all trash generated from project construction and operation is contained within covered, secured trash bins that are inaccessible to wildlife, and emptied on a regular basis/ prevented from overflowing. In addition, to minimize mammalian and avian predation on plovers, the Navy will continue predator control in occupied plover habitat along Silver Strand beaches, as required by the biological opinion on the Navy's SSTC Operations (FWS-SDG-08B0503-09F0517), which are anticipated to minimize any increases in predation associated with the project.

Project construction and operation could also increase human disturbance in the plover nesting areas. To minimize these impacts, the existing gate along the western perimeter fence allowing beach access will remain locked, and project personnel will not be allowed beach access during the plover nesting season.

Plover Critical Habitat

Approximately 0.15 acre of plover critical habitat (Subunit CA 55F) will be directly impacted by construction of the new access road in Caltrans ROW along SR-75 (Figure 2). Of the four primary constituent elements (PCEs) outlined in the final critical habitat designation (Service 2012), PCEs 1 to 3 are related to habitat required by the plover for feeding, breeding, and sheltering, and PCE 4 relates to the plover's requirement for habitat with minimal human disturbance for survival and reproduction. The 0.15-acre impact area consists of southern foredune habitat that is vegetated with nonnative ice plant (*Carpobrotus chilensis*) and some coastal sage scrub species, is disturbed by vehicle traffic on SR-75, and does not provide suitable habitat for plovers. Therefore, this area does not currently contain the PCEs of plover critical habitat, although it could be restored to support PCEs. To minimize impacts to plover critical habitat associated with increased human disturbance during project construction and operation, the Navy will construct permanent visual and noise barriers to obscure the proposed entry control point on the north end of the site from adjacent occupied plover critical habitat. The Navy will also offset the permanent loss of 0.15 acres of critical habitat through restoration of plover habitat on SSTC-South, outside of the existing perimeter fence.

Rail

Although not known or expected to occur on the project site, rails are known to occur east of SSTC-South in the San Diego Bay in the South Bay Marine Biological Study Area and at the nearby San Diego Bay National Wildlife Refuge (Figure 2). SR-75 separates SSTC-South from rail-occupied habitat in the South Bay Marine Biological Study Area. Navy-owned lands that are part of the South Bay Marine Biological Study Area have historically supported up to five pairs of rails, and the closest known rail was recorded approximately 620 feet from the SSTC-South boundary in 2005.

Although no direct impacts are expected, increased noise and predation associated with project construction and operation could indirectly impact rails. Construction, including demolition and associated debris removal, will result in increased construction-related traffic from SSTC-South along SR-75 to the City of Imperial Beach. Complete demolition will occur at a rate of about 10 percent each year, resulting in an increase in truck traffic along SR-75 adjacent to the South Bay Marine Biological Study Area where rails occur year-round. According to the BA, the maximum number of construction-related trips estimated for project construction is not anticipated to double the existing traffic on area roadways (i.e., doubling traffic volume increases noise levels by 3 dBA [A-weighted decibels (dB)], which is a less than perceptible change to the human ear). Thus, traffic noise levels generated by construction traffic will not result in a substantial increase in noise levels (i.e., +5 dBA) along project roadways. Therefore, despite an increase in vehicle traffic associated with project construction, the effects to rails are anticipated to be minimal.

Upon completion of construction of the Coastal Campus, it is anticipated that 3,045 personnel will relocate to SSTC-South, which will result in a permanent increase in vehicle traffic along

SR-75. However, according to the BA, this increase in traffic along SR-75 is not likely to increase noise levels above current conditions.

Rails could also be indirectly impacted by construction and operation of the project due to increased predation resulting from the addition of new structures (i.e., construction equipment, tall buildings, utility poles, fences, and trees) that provide perches for avian predators. However, implementation of the general and species-specific measures proposed to minimize indirect impacts of increased avian predation on the plover during construction and operation will also minimize such impacts on the rail. Such measures include ensuring no net increase in the number of trees onsite; trimming/pruning of all trees onsite to reduce nesting by predatory birds; and incorporating design features such as anti-perching devices on light poles, rooftops, and other perching locations to minimize perching by avian predators. The trash control and ongoing predator control required by biological opinion FWS-SDG-08B0503-09F0517 discussed above for plovers will also benefit rails.

CONCLUSION

In summary, the Navy will implement significant conservation measures (Enclosure) as part of the project to avoid, minimize, and/or offset potential impacts to federally listed species and designated critical habitat. Based on the site and species' information described above, and the Navy's commitment to implement the conservation measures, we conclude that all potential impacts on the bird's beak, fairy shrimp, plover, plover critical habitat, and rail will be avoided or reduced to a level of insignificance (i.e., unable to be meaningfully measured, detected, or evaluated) warranting our concurrence with the Navy's determination that the project is not likely to adversely affect these species or critical habitat. Therefore, the interagency consultation requirements of section 7 of the Act have been satisfied. Should project plans change or if additional information on the distribution of listed or proposed species becomes available, this determination may be reconsidered and further section 7 consultation may be required.

Thank you for your coordination on this project, and your continued efforts to conserve federally listed species and their habitats while supporting the Navy's military mission. If you have any questions or concerns regarding this informal consultation, please contact Tannika Engelhard at 760-431-9440, extension 202.

Sincerely,

A handwritten signature in black ink, appearing to read 'Karen A. Goebel', with a stylized flourish at the end.

Karen A. Goebel
Assistant Field Supervisor

Enclosure

The Coastal Campus project includes the following general and species-specific conservation measures (CMs) that the Navy will implement to avoid, minimize, and/or offset impacts to the bird's beak, fairy shrimp, rail, plover, and plover critical habitat. These measures support the Service's concurrence with the Navy's determination that the project may affect but is not likely to adversely affect the bird's beak, fairy shrimp, rails, plovers, or plover critical habitat in accordance with section 7 of the Endangered Species Act of 1973 (ESA).

General Conservation Measures – Construction and Maintenance

- CM 1. A project biologist contracted by the Navy and approved by NBC NRO will oversee the avoidance and minimization measures, including any required surveys and monitoring activities. The project biologist will be knowledgeable of the federally listed species and associated habitats known or potentially occurring in the project area. Different project biologists may be designated for specific measures based on the qualifications necessary to satisfy the specific measure. If multiple project biologists are required, their activities will be coordinated through one primary project biologist. The project biologist(s) will have the experience and training necessary to conduct tasks described in the BA. Minimum standards for experience and training will be determined in advance by the Navy and will be dependent on the specific task being addressed by the biologist. A statement of qualifications, including a resume of experience and training for each designated project biologist, will be submitted for review and approval to NBC NRO. Generally, when a project biologist is needed, the biologist will (1) be familiar with the federally listed species and associated habitats that require the survey or monitoring activity; (2) have a bachelor's degree with an emphasis in ecology, wildlife science, or related science; and (3) have previous experience with applying measures to avoid and minimize impacts to the listed species in the project area. In addition, where applicable, the project biologist will possess an ESA section 10(a)(1)(A) permit specific to the species and type of surveying or monitoring required. The biologist's resume, qualifications statement, and permit number, if required, will be submitted to NBC NRO. The correct number of appropriately trained biological monitoring staff will be present during all construction (pre-construction, construction, and post-construction) activities (i.e., vegetation clearing, grading, trenching, drilling) to ensure that ESA and Clean Water Act avoidance and minimization measures are carried out correctly.
- CM 2. If, during the design phase of the proposed action, ground-disturbing activity within the footprint, such as geological testing, is conducted, NBC NRO will be notified at least 15 days before the activity is scheduled to occur. NBC NRO approval will be required for any such activity, and the location of the activity will be reviewed to determine if it should be monitored by a biological monitor who is approved by NBC NRO because the location is near a sensitive biological resource. Monitoring of such sites will occur to ensure minimal damage to sensitive resources and adequate restoration of disturbed areas. All temporary effects associated with the geotechnical boring surveys will remain within the footprint of the project area, as described in the BA. The project

biologist will work with the boring crews to avoid and minimize risks to listed resources to the maximum extent practicable, including approving driving routes to reach the boring sites. If it is determined that the geotechnical borings will potentially result in permanent effects to listed species, NBC NRO will coordinate accordingly with the Service. If ground-disturbing activity will take place outside of project limits as described in the BA, an analysis of potential effects to listed species will be required and additional consultation with the Service will occur for areas outside those described in the BA.

- CM 3. All construction will take place within the project footprint defined in the BA contractor(s) will be informed that construction activity must be confined within established limits.
- CM 4. Contractor(s) will be provided with digital files showing the project limits used for the environmental analyses in the final version of the BA. Digital files and hardcopy maps will include the locations of federally listed species and sensitive habitats (including vernal pools and their watersheds). Contractor(s) will be required to coordinate with NBC NRO during design and construction to ensure that projects stay within the limits identified.
- CM 5. The project has a goal of zero storm water discharge (capture 100 percent of the discharge). However, if this goal cannot be achieved, runoff during construction and post-construction operations will be minimized and treated through measures which include but are not limited to preparing a storm water pollution prevention plan; applying soil stabilizers or other measures for erosion control on unpaved access roads; and implementing low impact development features.
- CM 6. Standard BMPs to control dust, such as watering site during construction, covering truckloads and stockpiles, and applying soil stabilizers on unpaved access roads will be implemented during construction.
- CM 7. The project biologist will monitor construction activities to ensure compliance with required avoidance and minimization measures, and will keep the project manager and NBC NRO informed about construction activities that may threaten sensitive biological resources. The project biologist will record daily construction activities and provide an electronic version of all weekly biological monitoring reports to NBC NRO and the Navy Construction Manager. The project biologist will have the ability to halt activities to avoid effects to listed species.
- CM 8. All construction and maintenance personnel will receive environmental training from the project biologist or NBC NRO before commencing work. The environmental training will be on the resources and avoidance and minimization measures involved in the project and the requirements and boundaries of the project. Environmental training will include a description of sensitive species and habitats potentially occurring on or

near the project site or greater project area, details on each species' habitat requirements, the protective measures to be implemented for each species, the role of the project biologist and the responsibilities of those on site to protect biological resources, the importance of complying with avoidance and minimization measures, the method for reporting problems, and the steps to take for problem resolution.

- CM 9. The project will have a designated footprint and the project biologist will ensure that all construction personnel remain within the limits of the project footprint for the duration of project activities. The project footprint is considered the project limits and no construction will be permitted outside of this footprint.
- CM 10. Where adjacent to native plant communities and determined necessary by NBC NRO, construction fencing will be installed around the outer perimeter of the project limits to reduce human disturbance to these adjacent natural habitats.
- CM 11. Construction and maintenance workers and Navy and civilian personnel who use the facilities in the future will not be permitted to bring any domesticated pets to any of the construction sites or facilities to ensure that domestic pets do not affect wildlife through harassment or predation in adjacent natural habitats. This does not apply to military working dogs as training impacts on wildlife from military working dogs have already been analyzed in the biological opinion FWS-SDG-08B0503-09F0517 which contains specific conservation measures for military working dogs at SSTC-S that must be followed.
- CM 12. Natural areas temporarily impacted by construction of the water pipeline (Option 1 or 2) will be restored to native vegetation following construction. A restoration plan will be submitted and approved by NBC NRO before initiating any restoration work. Restoration will be initiated with 12 months of the completion of water pipeline construction.
- CM 13. To comply with EO 13112, National Invasive Species Act, Federal Noxious Weed Act, and Noxious Plant Control Act, construction and maintenance contractors will ensure that all equipment and/or vehicles will be clean and free of mud, dirt, and weeds before entering SSTC-South. When washing wheeled vehicles, the front wheels will be turned from lock-to-lock to allow for exposure of surfaces that may hold weed seeds. Invasive plants with an overall moderate or high ranking in the most current California Invasive Plant Council Inventory will be considered as "weeds". The project biologist will be knowledgeable of and able to identify weed species listed in the California Invasive Plant Council Inventory. Additional qualifications may be specified by NBC NRO for the project biologist handling weed management. The project biologist will report all new weed species invasions (whether they are new to SSTC-South or new to the specific project site) to NBC NRO.
- CM 14. Avoidance and minimization measures adopted as part of individual projects will

include all those described in this informal consultation. Where in conflict, conservation measures listed in the informal consultation will supersede those listed elsewhere.

- CM 15. Written approval by the NBC Wildlife Biologist and NBC Botanist is required prior to finalization and implementation. Engagement and coordination with the aforementioned subject matter experts in the Request for Proposal (RFP) and design process must occur from the beginning to ensure timely coordination so as to afford appropriate opportunities for project review and modification to comply with Federal laws and regulations, to protect endangered/threatened species and habitats in close proximity to the project site, and to comply with the Secretary of the Interior Standards for Rehabilitation. Subject matter experts must be contacted during RFP development and prior to the kickoff-meeting of the project design.

Species-Specific Conservation Measures – Construction, Operation, and Maintenance

In addition to the general CMs outlined above, the Navy will implement the following species-specific CMs to minimize impacts to fairy shrimp, rail, plovers, and plover critical habitat.

Fairy Shrimp

- CM 16. Avoidance and minimization of indirect effects to fairy shrimp-occupied habitat adjacent to the project footprint will occur through BMPs for dust and erosion control as outlined above. In addition, NBC NRO will review specific BMPs (e.g., sediment fencing intended to protect vernal pools) before measures are implemented to avoid potential adverse effects (e.g., altered hydrologic regime) of the BMP and determine whether special post-BMP measures are warranted (e.g., revegetation of areas temporarily impacted). No trenching will occur within vernal pool watershed areas in association with BMPs. Additionally, storm water coming from the project footprint, both during and after construction, will be directed away from occupied basins and their watersheds to prevent contaminants and sediment from flowing off the project footprint and into adjacent habitat. All storm water coming from the project will be captured, directed to storm drains, and prevented from entering vernal pools or their watersheds.
- CM 17. To avoid effects to fairy shrimp-occupied habitat, known occurrences within 500 feet of project boundaries will be identified on project demolition and construction plans and, if determined necessary by NBC NRO or the project biologist, occupied habitat will be clearly indicated in the field with markers or exclusion fencing. Known populations and restricted areas will be monitored by the project biologist (familiar with the habitat of species) during construction phases, as determined necessary by NBC NRO. If deemed necessary by NBC NRO, a 100-foot non-disturbance buffer will be established around each vernal pool watershed and exclusion fencing, markers, or BMPs will be established around the non-disturbance buffers to prevent construction-related runoff and sedimentation from entering the pools.

- CM 18. To avoid impacts to vernal pools resulting from unauthorized trespass during construction, operation, and maintenance activities, signs and/or gates will be installed at all locations that could provide potential access to the vernal pool watershed (i.e., dirt access roads or foot paths) prior to the initiation of project construction. The type and placement of signs and/or gates will be determined by NBC NRO. Signs and/or gates will be regularly maintained and remain in place for the life of the project.

Plover and Rail

- CM 19. The Navy will distribute educational materials and/or install interpretive panels to inform military and civilian personnel of the sensitive species on SSTC-South and measures in place to avoid effects (e.g., no recreational use of the beach, meaning activities not associated with approved training, is permitted).
- CM 20. Construction during the breeding season within 300 feet of plover nesting locations will be avoided to the maximum extent feasible. The nesting season occurs from approximately 1 March through 15 September, but varies depending on species and environmental conditions for each year. The exact timing of construction to avoid the nesting season (when construction will occur within 300 feet of occupied habitat) will be agreed upon by NBC NRO and Service. If construction must occur during the nesting season within 300 feet of occupied plover habitat, NBC NRO, in coordination with the Service, will determine the locations to construct noise and visual attenuation barriers of plywood 12 feet tall to mitigate any potential temporary noise and visual effects to nearby plover breeding locations. NBC NRO may determine the need for additional noise attenuation and light reduction measures for any building or bunker demolition that may take place during the breeding season.
- CM 21. In the event that nighttime construction work is required, prior approval will be required by NBC NRO. Any artificial lighting required will be shielded away from native vegetation communities, beaches, and SR-75.
- CM 22. Other methods of reducing light pollution (e.g., dusk-to-dawn sensor activation, low-lumen or limited-spectrum lighting) will be applied wherever possible. Light poles and light placement will be constructed at the lowest height possible (considering security constraints) to reduce effects to the surrounding natural resources by reducing raptor perching sites and to reduce light pollution.
- CM 23. NBC NRO will review project design features (during the design phase) to ensure that building designs minimize effects to plovers and rails. Design features that prevent raptors and avian predators from perching near sensitive avian species nesting habitat may include the use of anti-perching devices on light poles, rooftops, and other perching locations. Anti-nesting devices will be installed on appropriate structures to prevent prey species from nesting on buildings, which may attract predatory avian

species. Additional building design features may include minimizing building heights to reduce bird collisions, altering roof pitch designs to minimize perching, and limiting the number of new light poles or new perching structures. Light poles and light placement will be constructed at the lowest height possible (considering security constraints) to reduce effects to the plover and rail by reducing raptor perching sites and to reduce light pollution.

- CM 24. During construction, equipment (such as cranes) that could provide temporary supplemental perches for birds of prey and predatory birds will be staged and stored when not in use at least 500 feet away (inside the project footprint) from habitat occupied by plovers. Equipment staging and laydown areas will be approved in advance by NBC NRO to ensure the areas are far enough away from occupied habitat. The project biologist will monitor construction activities to determine if equipment is providing supplemental perches, and make recommendations to reduce perching opportunities for avian predators.
- CM 25. Project design for all electrical upgrades and associated facilities will follow the Avian Power Line Interaction Committee's Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC 2012).
- CM 26. New buildings and structures will incorporate a bird-friendly design to reduce and prevent birds from colliding with buildings. Bird-friendly design features include transparent passageways, corners, atria, or courtyards so that birds do not get trapped; appropriately shielded outside lighting that is directed away from native habitats to minimize attraction to light-migrating songbirds; interior lighting that is turned off at night or designed to minimize light escaping through windows; and landscaping that is designed to keep birds away from the building's façade. Use of non-reflective or opaque glass; external shades (or other devices to reduce glare, transparency, or reflectiveness) on windows; ultraviolet patterned glass; angled glass; and/or louvers can aid in reducing bird collisions. Additionally, night-time lighting will include bird-friendly design features such as shielded lights (to reduce ambient light into nearby native habitats), use of motion detectors, dusk-to-dawn sensor activation and other automatic controls, low-lumen or limited-spectrum lighting, and lighting design that uses shields to prevent light from shining upward into the sky (Sheppard 2011). NBC NRO will be consulted to ensure the minimization measures are incorporated to prevent window strikes.
- CM 27. To avoid impacts to plovers resulting from operation of the project (i.e., causal outdoor recreation such as walking or running within occupied plover habitat), the existing gate along the western perimeter fence allowing beach access will remain locked at all times during the plover breeding season except when authorized access is granted.
- CM 28. All proposed planting palettes, landscape designs, and installation of trees will be submitted for review and approval by NBC NRO and Navy Landscape Architect and

will use native, drought-tolerant plants appropriate for SSTC-South, NAB Coronado, and NASNI. Invasive plant species will not be included in landscape plantings. A list of suitable landscape plants (including trees) is included in the Landscaping and Installation Appearance Plan Approved Plant List in Appendix H of the Naval Base Coronado Integrated Natural Resources Management Plan (Navy 2013). To reduce the effects of nesting avian predators in trees within the project footprint, there will be a 1:1 ratio of trees removed to trees planted so there is no net increase in the number of trees from current conditions. Trees will not be placed within 300 feet of the western fence line. Trees will be spaced far enough apart so that when full grown their branches will not be touching. Trees will be trimmed or pruned to open up the canopy of the trees to prevent nesting of American crows (*Corvus brachyrhynchos*) and/or common ravens (*Corvus corax*).

- CM 29. All trash generated from construction, operation, and maintenance of the project will be contained within covered, secured trash bins that are inaccessible to wildlife and emptied on a regular basis and prevented from overflowing. All exposed food waste or trash generated from food products (e.g., wrappers, food containers) will be removed from the site on a daily basis to prevent attraction of predators (e.g., American crows or common ravens and mammalian scavengers such as rats [*Rattus* spp.], raccoons [*Procyon lotor*], and skunks [*Mephitis mephitis*]).

Plover Critical Habitat

- CM 30. A visual obstruction is necessary to obscure the proposed entry control point on the north end of the site and the vehicles using the deceleration lane from adjacent occupied critical habitat for the plover on Silver Strand State Beach and from adjacent occupied plover habitat at the north end of SSTC-South. Construction of the entry control point will require grading to access SR-75 due to existing topography, slope stability, and the need for suitable vehicle access associated with the entry control point. Pre-construction engineering may indicate that the grading and site preparation itself may create a topographic visual barrier that adequately obscures the entry control point from the adjacent critical habitat for the plover. However, if engineering design for the entry control point does not create conditions that obscure the site from critical habitat for the plover, a permanent stonewall, concrete wall, or earthen berm or screening fence will be constructed within the project footprint along the west side of the entry gate road prior to the initiation of construction of the traffic and entry gate improvements. The height and length of the wall or fence will be determined by NBC NRO and USFWS. The wall or fence will have anti-perching devices installed on the top to prevent birds of prey from using the wall or fence for perching.
- CM 31. During the design phase, NBC NRO will be consulted regarding the exact location of the entry control point. If feasible, the entry control point will be located as far south along SR-75 as possible to reduce the potential for disturbance to plovers within critical habitat from humans and vehicles entering and leaving SSTC-South. To the maximum

extent feasible, construction of the new proposed entry control point and adjacent security fence will take place outside of the plover nesting season (which generally occurs from 1 March through 15 September, but this may vary slightly from year to year).

- CM 32. To offset permanent impacts to plover critical habitat, the Navy will restore/enhance 0.15 acres of plover habitat through removal of ice plant along the western SSTC-South boundary (outside of the fence line) within 12 months of the completion of construction activities in plover critical habitat. All ice plant removal will be accomplished during the non-nesting season and will be completed using a work crew with hand tools or machinery (i.e., a bobcat or loader with grapppler attachment).

ADOPTED FINDINGS ON CONSISTENCY DETERMINATION

Consistency Determination No.:	CD-0003-14
Federal Agency:	Department of the Navy (Navy)
Location:	Silver Strand Training Complex - South, Coronado, San Diego County (Exhibits 1 and 2)
Project Description:	Coastal campus development comprising 24 projects and 1.5 million square feet of new facilities, constructed over a 10-year period
Commission Action:	Concurrence
Prevailing Commissioners:	Commissioners Cox, Howell, McClure, Mitchell, Turnbull-Sanders, Vargas, and Chair Kinsey

SUMMARY OF COMMISSION ACTION

The Navy has submitted a consistency determination for the construction of a new Coastal Campus at Naval Base Coronado (NBC), located on Coronado Island and the Silver Strand

peninsula, San Diego County (**Exhibit 1**). The project involves the construction, operation and maintenance of a developed campus providing approximately 1.5 million square feet of new facilities to support the operations, logistics, field and classroom training, and administration of Naval Special Warfare Command (NSWC). The project would be located on the northern and central portions of the Silver Strand Training Complex – South (SSTC-S) (**Exhibits 1 – 4, 5**). The project also includes road and utility improvements, including a new northern entrance to the site, road upgrades, and a new right-turn lane on State Highway 75 (SR-75). Full build-out of the NBC Coastal Campus would result in new development covering approximately 162 acres of the SSTC-S site, with construction occurring over a period of approximately ten years.

The project site contains multiple environmentally sensitive habitats areas (ESHA) and wetlands, including vernal pools, southern foredunes on the seaward margin of the training complex, Diegan coastal sage scrub and maritime succulent scrub, and coastal freshwater and saltwater marshes, along with a number of California Native Plant Society (CNPS)-listed rare and endangered plant species (**Exhibit 6**). The project has been sited to avoid many, though not all, of these environmentally sensitive habitat areas (ESHA). The development footprint coincides with previously disturbed and developed areas that nonetheless support large numbers of Nuttall's lotus (*Acmispon prostratus*), an annual herb considered by the CNPS to be critically-imperiled in California, and at high risk of extinction, and which the Commission has determined to be ESHA under the Coastal Act. The Navy has agreed to provide at least 3:1 mitigation for impacts to Nuttall's lotus through restoration of 7 acres of appropriate habitat, and to relocate the proposed waterline to avoid impacts to sensitive habitats. The Commission therefore finds that the proposed project, though not fully consistent, is consistent to the maximum extent practicable with the environmentally sensitive habitat policies of the California Coastal Management Program (CCMP) (Coastal Act Section 30240).

The southern portion of the proposed water line would retain and reuse an existing pipeline, and thus would avoid the need for trenching and fill within wetlands and vernal pools. The Commission therefore finds the project **consistent** with the wetland policy of the CCMP (Coastal Act Section 30233).

Available sea level rise projection tools indicate that the project site will become increasingly vulnerable to flooding as sea level increases (**Exhibit 13**); this hazard could be exacerbated by on-going beach recession along the southern Silver Strand. However, the Navy has indicated that there are no other feasible alternative sites within NBC at lower risk under future conditions of higher sea level, and it has provided evidence that the site would not be at risk of inundation within the design life of the project assuming three feet of sea level rise. Therefore, the Commission finds that the proposed project is **consistent** with the hazards policies of the CCMP (Coastal Act Section 30253(a) – (b)).

Visual modifications would be most prominent from the northern approach along SR-75 and the Bayshore Bikeway. While most of the new structures would be similar in height and scale to existing structures, the project also includes a 120-foot tall parachute drying tower that would be highly obtrusive. However, relocating this structure to a different NBC installation would result in significant logistical problems, and generate additional traffic and vehicle trips in potential

conflict with other Coastal act policies (e.g., coastal access, vehicle miles traveled). The Navy has agreed to examine siting alternatives at SSTC-S to minimize the tower's visual impact, and to share building designs with the Commission and the City of Coronado as soon as they are publically-available. The Commission therefore finds that the proposed project is **consistent** with the visual and scenic resources policy of the CCMP (Coastal Act Section 30251).

Public access would not be directly affected. However, increases in traffic congestion accompanying the project could limit public access to the coast during periods of high visitation (e.g., weekends, holidays, summers) during the ten-year construction period. The Navy proposes to carry out a number of traffic improvements (e.g., signal and lane adjustments) at key intersections to reduce congestion, and has agreed to restrict construction traffic on weekends and holidays and to expedite the construction of a new northern entrance to the site. Thus the Commission finds that the proposed project is **consistent** with the public access and recreation policies (Coastal Act Sections 30210-30212, 30220, 30252) and the energy and vehicle miles traveled policy (Coastal Act Section 30253(d)) of the CCMP.

The Commission finds that the proposed project consistent with the relevant water quality policy (Coastal Act Section 30231) and cultural resource policy (Coastal Act Section 30244) of the CCMP.

For the above reasons, the Commission **concurs** with CD-0003-14.

I. FEDERAL AGENCY'S CONSISTENCY DETERMINATION

The Navy has determined that the project is fully consistent with the California Coastal Management Program (CCMP), and thus, that it satisfies the standard of being consistent to the maximum extent practicable.

II. COMMISSION ACTION, MOTION AND RESOLUTION

A. COMMISSION ACTION – CONCURRENCE

On November 12, 2014, by a vote of seven in favor, four opposed, the Commission concurred with the consistency determination submitted by the Navy on the grounds that the project is consistent to the maximum extent practicable with the policies of Chapter 3 of the Coastal Act. Because that action differed from the Commission staff's proposal, the action proposed in this staff report is the adoption of findings to reflect the Commission's action.

B. MOTION AND RESOLUTION

Staff recommends that the Commission adopt the following motion in support of its decision:

Motion:

I move that the Commission adopt the following findings in support of its concurrence with consistency determination CD-0003-14.

The staff recommends a YES vote on this motion. Pursuant to Section 30315.1 of the Coastal Act, adoption of findings requires a majority vote of the members of the prevailing side who are present at the hearing where the findings are adopted, with at least three of the prevailing members voting. Only those Commissioners on the prevailing side of the Commission's action are eligible to vote. A yes vote by the majority of the prevailing Commissioners listed on page 1 of this report who are present at the January, 2015 hearing will result in adoption of these findings.

Resolution to Adopt Revised Findings:

The Commission hereby adopts the findings set forth below in support of its November 12, 2014 concurrence with consistency determination CD-0003-14, submitted by the Navy for the proposed project, on the grounds that the findings support and accurately reflect the reasons for the Commission's November 12, 2014 concurrence and determination that the project is consistent to the maximum extent practicable with the California Coastal Management Program.

III. APPLICABLE LEGAL AUTHORITIES

Standard of Review

The federal Coastal Zone Management Act (“CZMA”), 16 U.S.C. § 1451-1464, requires that federal agency activities affecting coastal resources be “carried out in a manner which is consistent to the maximum extent practicable with the enforceable policies of approved State management programs.” Id. at § 1456(c)(1)(A). The implementing regulations for the CZMA (“federal consistency regulations”), at 15 C.F.R. § 930.32(a)(1), define the phrase “consistent to the maximum extent practicable” to mean:

... fully consistent with the enforceable policies of management programs unless full consistency is prohibited by existing law applicable to the Federal agency.

This standard allows a federal activity that is not fully consistent with California’s Coastal Management Program (“CCMP”), which are the policies of Chapter 3 of the Coastal Act (Cal. Pub. Res. Code §§ 30200-30265.5), to proceed, if full compliance with the CCMP would be “prohibited by existing law.” In reviewing the project the Commission determined that the project complied with the “maximum extent practicable” standard.

IV. FINDINGS AND DECLARATIONS

A. PROJECT DESCRIPTION & BACKGROUND

The Navy has submitted a consistency determination for the proposed construction and operation of a new developed campus (“Coastal Campus”) within the Silver Strand Training Complex-South (SSTC-S), Naval Base Coronado (NBC), in San Diego County (**Exhibits 1, 2**). The Navy proposes to add approximately 1.5 million square feet of new instructional and administrative facilities at SSTC-S over a ten-year period in order to support logistics, operations, classroom training and administration for the Naval Special Warfare Command (NSWC).

Site Description & Project Purpose

NBC comprises eight separate installations in San Diego and Los Angeles counties, including several on the Silver Strand peninsula and Coronado Island. SSTC-S consists of 548 acres of land located on the southern end of Silver Strand, bordered by the City of Imperial Beach to the south, Silver Strand State Beach to the north, State Route 75 (“SR-75”) and San Diego Bay to the east, and the Pacific Ocean to the west. SSTC-S also includes offshore training areas below the mean high tide line which are owned by the State of California.

In its consistency determination, the Navy describes the mission of Naval Special Warfare Command as follows:

... to organize, train, man, equip, educate, sustain, and maintain combat readiness and deploy Naval Special Warfare (NSW) forces to carry out special warfare missions worldwide. NSW is composed of active duty Special Warfare Operators or Sea, Air and

Land (SEALs) team personnel; Special Warfare Boat Operators, also known as Special Warfare Combatant-Craft Crewmen (SWCC), reserve and support personnel and civilians. Since 11 September 2001, U.S. Special Operation Command (USSOCOM), of which NSWC is the maritime component, manpower has nearly doubled, the budget has nearly tripled and overseas deployments have quadrupled. These increases are primarily in response to ever-increasing wartime requirements.

The Navy's consistency determination goes on to explain that the proposed Coastal Campus is necessary to support this expanded role of special warfare in its worldwide mission, and that the campus would allow for the consolidation of NSWC's operations, training and administration at a single site:

The purpose of the proposed project is to (1) provide adequate facilities to support growth of NSWC on the west coast and (2) maintain the required levels of operational readiness of special warfare forces as mandated by Title 10 U.S.C. Section 167 and 5062. This is necessary because:

- 1. Congress mandated an expansion of Special Operations Force capabilities and NSWC has experienced and continues to experience substantial growth to meet the global operational demands for special operatives.*
- 2. Many NSW facilities are functionally obsolete and do not meet current or future requirements without expansion and renovation;*
- 3. NSWC and its subordinate commands are located at five separate installations of NBC (NASNI, NAB Coronado, SSTC, Naval Outlying Landing Field Imperial Beach (NOLFIB), and Naval Auxiliary Landing Field San Clemente Island (NALF SCI);*
- 4. On NAB Coronado alone, NSWC and supporting commands are spread throughout 60 facilities that are divided by SR-75;*
- 5. Consolidation of multiple commands into one geographic location will provide for more efficient operations and improve readiness; ...*

The following table from the Navy's Draft Environmental Impact Statement (DEIS, p. 1-5), illustrates NSWC's unmet facility needs:

Table 1

NSWC Functional Areas	Current Assets (square feet)	Requirements (square feet)	Percent of Requirements Met
<i>Administration</i>	<i>49,000</i>	<i>90,000</i>	<i>54%</i>
<i>Operations</i>	<i>310,000</i>	<i>737,000</i>	<i>42%</i>
<i>Logistics/Community Support</i>	<i>102,000</i>	<i>292,000</i>	<i>35%</i>
<i>Training (Indoor/Physical)</i>	<i>120,000</i>	<i>340,000</i>	<i>35%</i>

The Navy has been conducting its activities on its NBC bases for more than 60 years, including maritime and field training exercises at SSTC-S. In 2010 the Commission reviewed a consistency determination covering the proposed expansion and intensification of the Navy's training activities at SSTC-S and other installations (CD-033-10); the present project, while directly related to special warfare training, would not result in additional outdoor training activities that were not covered by that consistency determination. At present, SSTC-S contains four oceanside beach and boat training lanes as well as inland training areas and facilities within a fenced perimeter. Existing structures at the site include a handful of World War II-era buildings and structures, a grid of streets on the northern half of the base laid out in the late 19th century, remaining portions of the National Radio Receiving Facility (NRRF) Wullenweber Antenna Array, and several defunct bunkers and batteries included in the Fort Emory Coastal Battery Historic District. On the whole, however, the site is sparsely developed and contains large expanses of open space and habitat areas. The proposed development would result in the removal of a number of the existing structures and the placement of high density development over approximately 162 acres of the northern and central portions of SSTC-S.

A map of existing development at SSTC-S is provided in **Exhibit 3**. Aerial photos of the site are shown in **Exhibit 4**.

Project Description

The Navy's consistency determination describes the project as follows:

The proposed project includes the construction, operation and maintenance of a developed campus encompassing 24 military construction (MILCON) projects over a 10-year period of time. Three administrative facilities projects would establish a command-and-control core for oversight of subordinate commands. Nine facilities projects would be for operational unit needs for five West Coast SEAL teams and other operational units that provide communications and intelligence, surveillance, and reconnaissance (ISR) support. Five logistics and community support projects would provide a variety of support to operational units. Seven projects would sustain indoor training and training support for operational units. The proposed project includes related site improvements, such as

upgraded utilities, fencing, roads, parking; site preparation such as demolition of existing infrastructure as well as site grading and leveling ... the project also involves off-site traffic, access, and sewer infrastructure improvements ... No additional outdoor training is proposed.

The square footage of the 24 MILCON projects included in the proposal would match the unmet requirements listed in Table 1, above. The Navy has not provided specific site or build-out plans for the project; however, the general project footprint and a conceptual plan of the land uses proposed for the SSTC-S site are shown in **Exhibits 5a** and **5b**, respectively.

Project Alternatives

The Navy initially considered fifteen project alternatives, including several for locating the project at an alternate site in Southern California (**Exhibit 1**) or spreading the new facilities among multiple sites. The criteria used to select the alternatives were:

(1) to provide a location in proximity to existing federal facilities and military lands used by NSWC within the existing footprint of NBC; (2) to avoid adversely affecting current Navy missions; and (3) co-location of NSWC facilities to the extent feasible to optimize efficiency and primacy of use.

The Navy rejected twelve of the alternatives on the basis that they would not fulfill one or more of the selection criteria. In particular, locating the project at many of the alternate military installations would place it at too great a distance from existing NSWC facilities at NBC, or would interfere with current Navy missions at those sites. Dividing the project components among multiple sites outside of NBC would also run counter to the Navy's goal of consolidating NSWC activities within a single geographic location. The Navy ultimately analyzed three project alternatives, each placing the majority of the new facilities at SSTC-S, as well as a "no action" alternative (DEIS, pp. 2-1 to 2-68). Alternative 1, the Navy's "preferred alternative," would be to place all facilities at SSTC-S, and would include the demolition of Building 99, the largest existing historic battery on site. Key elements of the preferred alternative include the following:

- ***Consolidation of necessary NSWC facilities to one location on SSTC-South***
The campus would be concentrated in the northern and previously disturbed and developed portion of SSTC-S. Co-locating administrative, operational support, logistics, indoor training and training support, equipment and equipment maintenance functions into one area will optimize organizational efficiency, provide synergy as well as enable effective command and control. The consolidation of NSWC functions and facilities at SSTC-S would replicate similar NSW concentrations on the East Coast.
- ***Design and construction of logistical support buildings, equipment use (and equipment maintenance) training facilities (including an approximately 50-foot long by 80-foot wide by 120-foot tall parachute drying tower or paraloft), classroom and tactical skills instruction buildings, storage, and administrative facilities infrastructure; utilities; fencing; roads; and parking.***

SSTC-S occupies 2.5 miles of coastline (approximately 1.2 miles of bay and 1.3 miles of ocean) and is approximately 548 acres in size. The Coastal Campus' 24 building footprint would be limited to 161.8 acres in the northern portion of SSTC-S.

Considerations for site development include a historic bunker complex in the northern portion, an extensive network of vernal pools and wetlands in the southern portion, a portion of the historic Wullenweber Antenna Array that is being preserved, Western Snowy Plover nesting areas on the beach area beyond the perimeter fence, and various utility lines and easements (see Figure 8). All buildings, with the exception of the paraloft at 120 feet, would be limited in height to 45 feet, which is the highest structure currently existing in the northern portion of SSTC-S. Projects would use applicable sustainability and energy efficiency guidelines as well as conform to the NSWC MILCON Development Plan and the NBC Installation Appearance Plan to ensure cohesive and compatible development.

- ***Construction of a new entry control point providing immediate access to SSTC-S from State Route 75 (SR-75).***

The main gate access to SSTC-S is located in the southern portion and requires transit through a residential area of the City of Imperial Beach. Construction of a new entry control point in the northern portion of SSTC-S will provide direct access to the Coastal Campus from SR-75. Establishing the entry control point at the point where Hooper Boulevard intersects SR-75 would require road improvements, a new traffic signal on SR-75, a new southbound right-turn lane, a new northbound left-turn lane and construction of a 600 square foot sentry house. A temporary entry control point will be established initially to provide construction traffic access to the northern portion until the permanent gate and road improvements can be completed.

- ***Demolition of Building (Bldg) 99 (Bunker) as well as 20 other existing structures.***

Bldg 99 is part of a bunker complex eligible for listing on the National Register of Historic Places (NRHP). Bldg 99 is 4.6 acres in size, has a 17-foot thick armored roof with approximately 49,900 cubic yards of reinforced concrete and steel. It is located in the middle of the northern portion of SSTC-S and, once removed, would provide additional buildable space. Its demolition is subject to the Section 106 process of National Historic Preservation Act (NHPA). The bunker is the tallest structure in the northern portion of SSTC-S at 45-foot high. Comparatively, the existing Wullenweber antenna array, the most prominent structure on SSTC-S, is 100-feet high on the southern portion of SSTC-S. Demolition would be conducted with the use of small commercial explosives and/or diamond saws to initially break up the structure followed by drilling and hammering. Demolished concrete and steel will be reused as part of the construction material or removed to a local landfill. Demolition is expected to take 24 months; however the majority of debris removal would be concentrated over a 2 to 3 month period.

- ***Traffic, Access and Utility Improvements***

Future traffic improvements to five intersections along Palm Avenue (SR-75) in

Imperial Beach would be required in order to improve traffic flow during heavy commute times once the Coastal Campus is fully developed. On site water storage and tapping into existing 16-inch water main line for purposes of a 10-inch fire main and a 6-inch potable water service to the new buildings would be required. There may be a requirement to relocate a 16-inch water main within a 30-foot water easement. A new wastewater conveyance system along with a wastewater storage facility and pump station would be constructed. There may be a requirement to improve the City of Imperial Beach's sewer system. The current electrical system at SSTC-S would be placed underground.

Alternatives 2 and 3 considered by the Navy would be similar to the preferred alternative in that all or most of the new development would occur at SSTC-S. However, under Alternative 2, the Building 99 battery would be retained; under Alternative 3, the battery would be retained, and three new buildings would be constructed at the Naval Amphibious Base (NAB) Coronado and one new building at the Naval Air Station North Island (NASNI) instead of at SSTC-S (**Exhibit 5c**). This would require the demolition of ten existing buildings at NAB.

Access Road & Utility Improvements

Primary access to the project site during construction and operation would be from SR-75 along an improved northern access road (**Exhibits 5a-b, d**). The existing northern access road would be realigned and widened up to 72 feet, including additional turn lanes and improved ingress and egress from SR-75 in the Caltrans right-of-way. The existing northern access gate would also be replaced with a 600-square foot sentry house (plus permanent visual and noise barriers) to serve as the new entry control point.

The proposed project includes several utility improvements (including water, wastewater, natural gas and electrical service) at SSTC-S and within the City of Imperial Beach (**Exhibits 5a-b, e**). The Navy examined two options for upgrading water service to the Coastal Campus site. Under the Navy's original proposal (Option 1) a new 16-inch diameter water pipe would be installed in the coastal dune area just inside the western perimeter fence, east of the SSTC-S beach. The new water line would run approximately 9,875 feet from near the northern site boundary to the southern boundary of the YMCA Camp, and then extend eastward to connect back to an existing water line that extends into SSTC-S from Imperial Beach. The "Option 2" water line route would follow the Option 1 route across the northern portion of SSTC-S, but would then ~~have~~ turned eastward into the development footprint to connect with the existing water line. The existing water line, running from the development footprint southward into Imperial Beach, would be retained, with no trenching or ground disturbance required along its route in the areas south of the development footprint. In November 6, 2014, correspondence with Commission staff, the Navy indicated it would implement the Option 2 route. At the hearing, the Navy committed to modifying the waterline route to match one of the routes identified by the Commission staff in **Exhibit 6e**, which would avoid direct impacts to all sensitive habitats and species.

Upgrades and/or replacement of existing natural gas and wastewater lines are also proposed. These service lines run beneath Hooper Blvd. between Imperial Beach and the development

footprint, across the southern portion of SSTC-S. Upgrades to the City of Imperial Beach's sewer system may also be necessary at two locations (**Exhibit 5e**). The Navy has also proposed several traffic signal and lane improvements at intersections along SR-75 in order to offset projected increases in traffic congestion (*see* Subsection G, below) **Exhibit 5e**.

Project Schedule and Future Operations

Project construction is expected to begin in 2015 and be completed by 2024, with approximately 10% of construction occurring each year. At the hearing, the Navy stated that that northern access improvements would be initiated relatively early in the construction timeline, and completed by the beginning of 2018. Upon completion of the project, an estimated 3,045 Navy personnel would be rerouted for training from NAB Coronado to SSTC-S, increasing the total number of personnel onsite from about 300 at present to about 3,350.

Environmental Baseline

The 548-acre SSTC-S site contains a patchwork of land cover types and habitats (**Exhibit 6a**). Much of the northern and central portions of the site are characterized by the Navy as "urban/developed" or "disturbed habitat." Existing structures at the site include a handful of World War II-era buildings and defunct batteries included in the Fort Emory Coastal Battery Historic District several, a grid of streets on the northern half of the base laid out in the late 19th century for the planned Coronado Heights community, and the NRRF antenna array. Developed areas (62 acres) are comprised of existing buildings, bunkers and other structures, roads and paved areas, and areas occupied by and surrounding the remnant foundations of old buildings. Areas identified as disturbed habitat (174 acres) are dominated by non-native iceplant, which was planted in the 1950s to control erosion and wind-blown sand, but which has since invaded large areas of native vegetation, including the southern foredune habitat. It is important to note, however, that both the urban/developed and disturbed habitat types at SSTC-S continue to support native plant species, in particular Nuttall's lotus (*Acmispon prostratus*), an annual herb known to colonize sandy soils which have been disturbed or otherwise cleared of competing vegetation. Nuttall's lotus is especially abundant in the open sandy areas surrounding the abandoned building pads and in other breaks in the iceplant cover at SSTC-S, as well as in disturbed habitat areas at NASNI (**Exhibit 6b**).

B. OTHER AGENCY APPROVALS AND CONSULTATIONS.

U.S. Fish and Wildlife Service

The U.S. Fish and Wildlife Service (USFWS) has responsibilities over the proposed project under the Endangered Species Act and the Fish and Wildlife Coordination Act. The Navy requested consultation with the USFWS regarding potential project impacts on the federally endangered salt marsh bird's beak, San Diego fairy shrimp, and light-footed clapper rail, and on the threatened Western snowy plover and its designated critical habitat. The consultation concluded on September 12, 2014, and the Navy has incorporated a number of required conditions and modifications into the proposed project.

San Diego Regional Water Quality Control Board

The San Diego Regional Water Quality Control Board (RWQCB) regulates waste discharges into receiving waters in the project area under the federal Clean Water Act (33 U.S.C. §1251 et

seq.). The NBC operates under a National Pollutant Discharge Elimination System (NPDES) permit issued by the RWQCB, which would be modified as necessary to take into account changed conditions with the addition of the Coastal Campus. The Navy will also apply for NPDES General Construction permits for the individual MILCON projects included in the Coastal Campus.

Section 106 Consultation – State Historic Preservation Office

The Navy is engaged in formal consultation with the State Historic Preservation Officer under the National Historic Preservation Act (NHPA) for historic, cultural and archaeological resources at the project site, which is expected to be completed in February 2015.

C. ENVIRONMENTALLY SENSITIVE HABITAT AREAS

Coastal Act Section 30240 states:

(a) Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.

(b) Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.

Coastal Act Section 30107.5 defines environmentally sensitive area:

“Environmentally sensitive area” means any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments.

The southern and eastern portions of the SSTC-S site support extensive natural land covers and vegetation types, including non-native grassland (104 acres), wetlands, including coastal salt marsh (21 acres), vernal pools (11 acres) and freshwater marsh (0.16 acres), and small, scattered patches of coastal sage scrub (8 acres) and maritime succulent scrub (4.6 acres) communities (**Exhibit 6a**). The western shoreline of SSTC-S is covered by Southern foredune (41.8 acres) and beach (12.4 acres) habitats. These natural areas provide habitats for numerous plant and animal species, including several listed as threatened or endangered under the federal Endangered Species Act (*see* Subsection C, below).

The proposed development footprint under the preferred alternative has been sited to occur largely within urban/developed and disturbed habitat areas of SSTC-S, within the existing perimeter fence, in part to limit the impacts on sensitive habitats. However, some impacts will still occur. The direct impacts of the proposed project to plant communities and land cover types at SSTC-S are summarized in Table 2, below:

Table 2: Direct Plant Community and Land Cover Impacts of Coastal Campus Project

Plant Community/ Cover Type	Permanent Impacts from Coastal Campus (acres)	Water Line Impacts Option 1 / Option 2 (acres)	Sewer & Natural Gas Line Impacts (acres)
<i>Southern coastal salt marsh</i>	--	0.05 / --	--
<i>Freshwater marsh</i>	--	-- / 0.03	--
<i>Vernal pools</i>	--	-- / 0.01	--
<i>Diegan coastal sage scrub</i>	0.35	-- / 0.07	--
<i>Non-native grassland</i>	0.02	0.13 / 1.10	0.11
<i>Southern foredunes</i>	0.23	2.61 / 0.18	--
<i>Disturbed habitat</i>	114.06	2.12 / 1.87	0.01
<i>Urban/developed</i>	52.04	1.90 / 1.49	1.22
Totals	166.7	6.81 / 4.75	1.34

Sources: DEIS, pp. 3.7-78 to 3.7-79; USFWS Informal Consultation, 9/12/14.

In order to avoid, minimize, and mitigate potential impacts to environmental resources during construction and maintenance of the proposed development, the Navy will undertake a number of general conservation measures, including:

- Appointment of qualified project biologists to oversee avoidance and minimization measures, surveys, monitoring, construction activities, and permit compliance;
- Biological monitoring of ground-disturbing activities, as determined necessary by the NBC Natural Resources Office (NBC NRO);
- Restriction of construction activities to the defined project footprint;
- Provision of digital and hardcopy maps of the project footprint and locations of sensitive species and habitats to the project contractor;
- Establishment of a zero storm water discharge target (100% capture); if this proves infeasible, a stormwater pollution prevention plan (SWPPP) will be developed containing measures to minimize and treat runoff and control erosion;
- Implementation of standard dust control best management practices (BMPs);
- Environmental training for construction and maintenance personnel;
- Installation of construction fencing around project footprint where necessary to protect sensitive habitats;
- Exclusion of domestic pets from the project site during construction and future operation;
- Restoration of natural areas impacted by construction of the water pipeline;
- Compliance with federal law (e.g., EO 13112, National Invasive Species Act, Federal Noxious Weed Act, and Noxious Plant Control Act) intended to prevent the spread of invasive plants;
- Requirement of written approval from the NBC Wildlife Biologist and NBC Botanist prior to final project implementation.

Conservation measures specific to individual species or habitat types are discussed in more detail below. All general and specific conservation measures required by the USFWS informal consultation have been incorporated into the proposed project and are listed in **Exhibit 7**.

Given the above siting and habitat protection measures, the Navy would avoid direct impacts to many of the habitats the Commission would consider environmentally sensitive areas (ESHA) at SSTC-S. In most cases, the proposed project also includes adequate buffers (greater than 100 feet) between sensitive habitats and new development.

Nevertheless, as described below, the project still involves development within and affecting ESHA. The Coastal Act establishes a high standard for protection of areas that are identified as environmentally sensitive. Only resource-dependent uses, such as habitat restoration, are allowed within ESHA, and all development within or adjacent to an ESHA must be sited and designed to prevent significant disruption of ESHA.

The Coastal Act protections for ESHA are different in approach from certain other environmental laws. For example, the California Endangered Species Act, administered by the Department of Fish and Wildlife (CDFW), allows the “incidental take” of a state-listed species if the impacts of the take are minimized, fully mitigated, and would not result in jeopardy to the species.¹ Similarly, the U.S. Fish and Wildlife Service may issue incidental take permits under the federal Endangered Species Act for a listed species if the impacts are offset through a Habitat Conservation Plan.² However, with a few limited exceptions, Section 30240 of the Coastal Act does not allow development within ESHAs, even with mitigation. The primary exception applies if the proposed development is “a use dependent on the resource.” This fundamental requirement of the Act was confirmed in the *Bolsa Chica* case, wherein the Court found the following:

*Importantly, while the obvious goal of section 30240 is to protect habitat values, the express terms of the statute do not provide that protection by treating those values as intangibles which can be moved from place to place to suit the needs of development. Rather, the terms of the statute protect habitat values by placing strict limits on the uses which may occur in an ESHA ...*³

The only other exceptions would be: (1) if a Commission action were to result in a Constitutional “taking” of private property rights; (2) if the Commission were to find that a project posed conflicts between one or more Coastal Act policies, in which case the Commission could invoke the conflict resolution policy and authorize an activity that it determined met the requirements of Section 30007.5 of the Coastal Act because the conflict was being “... resolved in a manner which on balance is the most protective of significant coastal resources” (Section 30007.5); or (3) if the “consistency to the maximum extent practicable” standard applicable to federal agencies (and described above in Section III) presented a situation where avoiding development within ESHA was prohibited based on existing law.

Defining ESHA

ESHA, as defined in Section 30107.5 of the Coastal Act, is “...any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities.” Thus, Section 30107.5 sets up a two-part test for determining what constitutes ESHA. The first of these tests is whether an area includes plants, animals or their habitats that are either: (a) rare; or (b) especially valuable because of their special nature or role in an ecosystem. If it does, then the second test is whether such plants, animals, or habitats could be easily disturbed or degraded by human activities. If both tests are met, then the area where such plants, animals, or habitats are located is deemed ESHA by Section 30107.5.

In many instances when the Commission determines that a habitat qualifies as ESHA on the basis of a particular plant species, the Commission is guided in large part on whether the species is listed as a Rank 1 or Rank 2 species by the California Native Plant Society (CNPS) *Inventory of Rare and Endangered Plants of California*. The CNPS California Rare Plant Ranking system defines Rank 1B plants as “rare, threatened, or endangered in California, and elsewhere” (Rank 1A plants are those presumed extinct in California). Rank 2 plants are those that are “rare, threatened, or endangered in California, but more common elsewhere.” A threat code extension following the ranking (*e.g.*, Rank 1B.1, 1B.2, or 1B.3) further rates the species’ in terms of the percentage of occurrences that are “threatened” in California (with “.1” being the most threatened and “.3” being the least threatened). All plants appearing on CNPS Ranks 1 and 2 meet the definitions within the Native Plant Protection Act and the California Endangered Species Act as species eligible for state listing as a rare, threatened, or endangered plant. In addition, pursuant to the California Environmental Quality Act (CEQA) guidelines (Cal. Code Regs., Title 14, Section 15380), the effects of a development project on species which meet the criteria for listing, even if not currently included on any list, must be fully considered during project environmental review.

Given the significance of the CNPS ranking as a threshold for determining the relative significance of potentially adverse impacts on biological resources and for setting requirements for formulating related mitigation and monitoring programs, the Commission typically finds that plant species that are listed as Rank 1B or 2 and the area in which they grow meet the Coastal Act definition of an ESHA as they are both: (1) “*an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem;*” and (2) “*which could easily be disturbed or degraded by human activities or developments.*” Species with CNPS Rank 3 are those for which more information is needed before an appropriate list ranking can be assigned (*e.g.*, Rank 3 species may, after further review, be moved to Rank 1B or Rank 4). Rank 4 species are effectively on a “watch list,” comprising those plants which are of limited distribution or infrequent throughout a broader area in California. Plants in Ranks 3 or 4 may, in some instances, meet the criteria for listing and may, in some instances, meet the Coastal Act definition of ESHA.

Nuttall’s Lotus & “Disturbed” Habitat Areas

As shown in Table 2 (above) and **Exhibit 6b**, large areas of the proposed development footprint at SSTC-S are characterized as “Urban/Developed” or “Disturbed Habitat.” Developed areas at

SSTC-S include existing buildings, bunkers and other structures, roads, paved parking areas, and the abandoned foundation pads of former buildings. However, a comparison of the Navy's land cover designations (**Exhibit 6a**) with aerial photographs of the site (**Exhibit 4**) show that "Urban/Developed" areas at SSTC-S also include unpaved areas, some of which support native vegetation, in close proximity to structures or pavement. Disturbed habitat areas at SSTC-S are described as being dominated by non-native iceplant (*Carpobrotus spp.*), yet in places still support sensitive native plant species (**Exhibit 6b**). The most widespread of the rare plants occurring in developed and disturbed areas within the proposed development footprint is Nuttall's lotus (*Acmispon prostratus*) (**Exhibit 8**).

Nuttall's lotus is an herbaceous member of the pea family native to the dunes, beach, and coastal sage scrub communities of southern California. At present, the distribution of Nuttall's lotus is restricted to a narrow strip of coastal habitats in San Diego County, where it is known from just 33 locations between Tijuana and Carlsbad, including at SSTC-S and NASNI (CNPS 2014). Of these occurrences, all but six are small populations varying from a few to a few hundred plants; larger populations have been observed San Luis Rey River, San Elijo Lagoon, Mission Bay, NASNI, Silver Strand, and Border Field State Park, with by far the largest population found on the Silver Strand between NAB and SSTC-S (**Exhibit 9**, p. 5; Landis 2012). At this handful of locations, the plant can be very abundant, conforming to a common pattern among endangered species to be globally rare but locally abundant. The survival of such species may be at elevated risk because localized impacts may affect a large proportion of the population. Nuttall's lotus has undergone serious decline within its endemic range due to habitat destruction and fragmentation, and continues to be threatened by development, the spread of non-native plants and other land management activities. The existing population of Nuttall's lotus is severely fragmented, and has been estimated to have declined by 50 – 70% in the last ten years (Contu 2012; NatureServe 2014).

Due to these on-going threats and its extremely restricted range, Nuttall's lotus has been listed as a CNPS Rank 1B.1 rare and endangered species (see above), and is considered "critically imperiled" on both a state-wide and global basis. Nuttall's lotus is locally abundant at several NBC installations, with many thousands of individuals occurring within both natural and disturbed areas of SSTC-S and NASNI (**Exhibits 6b, 6c**). The apparent association of this species with developed areas at the project sites may reflect the absence of iceplant, which tends to out-compete native species for light, water, and space in coastal environments; periodic disturbance, clearing or exclusion of iceplant near development may have enabled Nuttall's lotus to persist in or colonize these areas. The local abundance of Nuttall's lotus at SSTC-S highlights the importance of this sub-population to the species continued existence; given the few known locations where Nuttall's lotus occurs, the recent declines in the population, and continued threats from development and invasive species, the sub-population at SSTC-S is especially valuable (see **Exhibit 9**, p. 4-5). Due to the extreme rarity of Nuttall's lotus and the ease with which it could be disturbed or degraded by human activities and development at the sites of the proposed project, the Commission's staff ecologist has determined that areas within SSTC-S and NASNI supporting this species meet the definition of ESHA under Coastal Act Section 30107.5 (**Exhibit 9**, p. 5). The staff ecologist (whose findings are incorporated by reference) states:

Nuttall's lotus is rare and declining due to loss of habitat, and the area supporting many thousands of the species at the Silver Strand Training Center – South clearly could be easily disturbed or further degraded by human activities and developments. Therefore, the area supporting the species meets the definition of Environmentally Sensitive Habitat Area in Section 30107.5 of the Coastal Act, despite the unusual, degraded landscape setting⁴. With the few data available, it is difficult to define the extent and boundary of this ESHA. The rare plant surveys noted the approximate locations of groups of individuals (Figure 3), but did not estimate the number of individuals represented by each filled circle or polygon. Also, this is an annual plant and a significant portion of the population is represented by the seed bank. In fact, the 2004 rare plant survey report suggested that, "[t]he fact that the lotus is found in...open areas, which historically supported dune and coastal sage scrub vegetation and now is overrun with ice plant, suggests that there may be a native seed bank still present underneath the ice plant." (Sauceda-Ortiz 2004). In the absence of detailed distributional data, the most conservative approach to the ESHA boundary would be to create a convex polygon that encompasses the documented locations of Nuttall's lotus on the sandy flats above the beach and foredunes but that excludes existing development that is in use. Such a polygon would also encompass most of the area proposed for future development.

The staff ecologist has also indicated that a 25-foot buffer between new development and occurrences of Nuttall's lotus is needed to protect the species (**Exhibit 9**, p. 6):

The area supporting Nuttall's lotus is unusual due both to the extensive remains of prior development and the extensive vegetative cover of the invasive iceplant. In order for this plant to survive and thrive, a management plan should be developed to remove the iceplant, restore native habitat, and provide a mosaic of sparsely vegetated areas, and control runoff. With such a plan in place, a 25-foot buffer would be adequate to protect the Nuttall's lotus ESHA.

Project Impacts to Nuttall's lotus and other CNPS-listed plants

As shown in **Exhibit 6b** construction of the proposed Coastal Campus at SSTC-S would result in the permanent removal of large stands of Nuttall's lotus in the central and western portions of the proposed development footprint, and the removal of numerous individual plants throughout the site, including at the new northern entry point to the base (**Exhibit 6d**). The installation of a new waterline in the "Option 1" configuration would also result in the removal of several individual lotus plants. Based on the plant survey results summarized in **Exhibit 6b** Nuttall's lotus would likely persist in the western dunes and several locations in the central and eastern portions of the site, but it appears that most occurrences of this species at SSTC-S, in any given year corresponding to many thousands of individuals, would be extirpated. Under project Alternative 3, which would place an unmanned aerial vehicle maintenance and storage facility at NASNI

⁴ In *Bolsa Chica Land Trust v. Superior Court* (1999), 71Cal.App.4th at p. 508, the Court of Appeal found that "...ESHA's, whether they are pristine and growing or fouled and threatened, receive uniform treatment and protection." The Nuttall's lotus habitat at the training complex could aptly be described as "fouled and threatened" but nonetheless meets the definition of ESHA in the Coastal Act.

rather than SSTC-S, Nuttall's lotus plants growing in a developed/paved area would also be permanently removed (**Exhibit 6c**).

In addition to these direct impacts on Nuttall's lotus, the proposed project would result in the permanent removal of several other CNPS-ranked rare and endangered plant species at SSTC-S (**Exhibits 6b, 6d**). The project would result in the removal of at least one individual of San Diego barrel cactus (*Ferocactus viridescens* var. *viridescens*) (Rank 2B), several Coast woolly-heads (*Nemacaulis denudata* var. *denudata*) (Rank 1B.2), and two individuals of California box thorn (*Lycium californicum*) (Rank 4) occurring within the proposed development footprint; and one or more individuals of Coast woolly-heads and Orcutt's pincushion (*Chaenaactis glabriuscula* var. *orcuttiana*) (Rank 1B.1) occurring along the proposed route of the Option 1 water line.

Commission staff requested that the Navy assess whether alternative facility configurations and building placements exist that would avoid the destruction of sensitive species and ESHA within the project footprint, and has requested that the Navy provide site build-out plans to allow the Commission to independently evaluate these alternatives.⁵ The Navy has declined to release site plans, providing the following response:

The Navy is in the preliminary site planning stages during which some preliminary plans have been developed. However, and most importantly, the Navy does not feel it appropriate to release those publicly given the sensitivity of the uses at the site and Naval Special Warfare Command's security concerns. Also, the Navy does anticipate that site development may change throughout the duration of the 10-year construction program, which is also a reason we opted to present a land use map with development envelope to the public, as opposed to providing a very specific site plan with building layout.

...

Acmispon prostratus (ACPR) is found across much of Coastal NBC. It is found in multiple locations on NASNI, as well as both the bayside and ocean-side areas of NAB Coronado and on SSTC-S. It is one of the focal species for management per the NBC Integrated Natural Resource Management Plan (INRMP). NBC does annual surveys to monitor its presence across the properties. The plant is very common on NBC, growing in the dune and foredune areas, disturbed and ruderal areas, and even within parking lots and pavement cracks and potholes of developed areas. Some areas where it is relatively common include: south of the runway on NASNI, within the tern nesting colony on bayside NAB Coronado, and along the fence and dunes of SSTC-S. Due to the Navy's need for open space and buffer areas around the three previously mentioned areas, and the presence of listed wildlife species in these areas (CLT and WSP), successful management of ACPR within those areas is highly likely. A population estimate doesn't exist for this species due to the large area it occupies and the sheer number of plants within those areas. However, every year a focused survey is done within the NASNI study area. The NASNI Study Area is situated just east of Southeast Runway 36 on NASNI, and is approximately 7.13 acres in size. Depending on rainfall, the ACPR population fluctuates between 15,000

⁵ September 5, 2014, correspondence between U.S. Navy and Commission staff.

*and 80,000 individuals. The total ACPR population on NBC is unknown, but is in the tens of thousands of individuals, and is found in areas with little development potential. Due to this fact, the Navy is likely able to manage tens of thousands of individuals of ACPR across multiple installations. ACPR will continue to persist along the fence line and dune/fore dune habitat of SSTC-S. ACPR may be able to persist in some ruderal and even developed areas within the proposed footprint as well. However, these areas are unknown, and most/all occurrences within the proposed footprint have the potential to be developed. Specifically, the developable area at the site is roughly 70 acres, when accounting for the various development considerations at the site, and the Navy is looking to maximize development of the proposed action within that area while striving to avoid designated resources and other areas of the site used for other operational elements. Due to the consolidation of facilities and the project footprint to avoid site resources, including WSP and SDFS, there may be very little flexibility to site buildings within the project footprint. Regarding *Lycium californicum*, there appear to be very few affected, and for *Nemacaulis denudata*, very few, if any, would likely be affected.*

In the absence of detailed plans, and in light of the Navy's statement that most or all occurrences of Nuttall's lotus (and other CNPS-listed plants) within the proposed project footprint have the potential to be developed, the Commission can only conclude that the project is located within ESHA and would result in, at a minimum, the loss of all individual plants located within the development footprint.

The Commission agrees that the presence and local abundance of Nuttall's lotus at other NBC installations and in areas of SSTC-S not slated for development indicates the potential for the species to persist outside of the proposed development footprint. However, in causing the removal of a significant portion of the extant population at the most important of the few locations known to support the lotus, the project would directly contribute to the trend of habitat destruction and alteration that has caused the species' decline. In other words, the cumulative impacts of development, including this project, threaten the continued existence of Nuttall's lotus throughout the coastal zone.

The Commission staff has also asked whether the Navy has evaluated alternative routes for the new water line that would avoid the impacts to ESHA of the "Option 1" configuration, which would require trenching in southern foredune and wetland habitats along the western fenceline (*see below*), and the removal of CNPS-listed plant species as discussed above. Commission staff suggested that an alternative location of the water line beneath Hooper Blvd. in the southern end of SSTC-S and beneath developed areas in the central and northern portions of the site would avoid disrupting ESHA.⁶

At the hearing, the Navy agreed to relocate the water line to one of the alternative routes suggested by the Commission staff in **Exhibit 6e**, which will avoid disruption of all sensitive habitats and species, including Nuttall's lotus.

⁶ September 17, 2014, correspondence between U.S. Navy and Commission staff.

The Commission recognizes the Navy's efforts to manage environmentally sensitive resources, including CNPS-listed rare and endangered plants, at its NBC bases, as exemplified by the 2013 Integrated Natural Resources Management Plan (INRMP 2013). The Commission is also sensitive to the unique security concerns present at a military base. However, the removal of a CNPS Rank 1B.1 species, which the Commission's staff ecologist has determined constitutes ESHA, is clearly inconsistent with the resource protection requirements of Section 30240 of the Coastal Act, both because the proposed development is not a resource dependent use, and because it does not protect against the significant disruption of habitat values.

Diegan Coastal Sage Scrub & Maritime Succulent Scrub

Diegan coastal sage scrub (CSS) is an endangered native plant community occurring in the coastal areas of Orange County, San Diego County and Baja California. Once widespread in coastal Southern California, this plant community has lost between 50 and 85% of its former area to agriculture and urban development, with the remainder highly fragmented (Rubinoff 2001; Taylor 2005). Remaining CSS habitat continues to be threatened by development, grazing pressure, altered fire regimes, and air pollution. Coastal sage scrub provides vital native habitat for indigenous and sensitive flora and fauna, including the federally-listed Coastal California Gnatcatcher, though this species is not known to inhabit the SSTC-S site.⁷ Several small stands of CSS are scattered across the eastern portion of the SSTC-S site.⁸ On drier sites, CSS grades into maritime succulent scrub, a related (and even rarer) plant association with higher frequencies of cacti and other succulents.⁹ Maritime succulent scrub occurs at SSTC-S in two locations (**Exhibit 6b**) in the eastern and southwestern portions of the site. Together, Diegan coastal sage scrub and maritime succulent scrub cover almost 13 acres of the site.

The Commission's determination as to whether any particular Diegan coastal sage scrub or maritime succulent scrub habitat constitutes ESHA has historically been made on a site-specific basis. In a number of past cases, the Commission has ruled that small stands of CSS do not constitute ESHA due to their isolation and distance from larger, more contiguous areas, and due to the fact that the stands did not support California gnatcatcher or other rare species. At SSTC-S, while the individual stands of these communities are relatively small, several support the CNPS-listed rare and endangered species Nuttall's lotus (Rank 1B.1), variegated dudleya (Rank 1B.2), San Diego barrel cactus (Rank 2B.1), and California box thorn (Rank 4.2). Stands of Diegan coastal sage scrub and maritime succulent scrub supporting these rare species are

⁷ The Navy reports a single sighting of a California gnatcatcher traversing the site in 2012 (DEIS, p. 3.7-52).

⁸ Coastal sage scrub at SSTC-S is dominated by native species including coast California buckwheat (*Eriogonum fasciculatum*), broom baccharis (*Baccharis sarothroides*), coast sagebrush (*Artemisia californica*), lemonade berry (*Rhus integrifolia*), and California encelia (*Encelia californica*); maritime succulent scrub at the site is dominated by coast cholla (*Cylindropuntia prolifera*), San Diego barrel cactus (*Ferocactus viridescens*), California boxthorn and variegated dudleya (*Dudleya variegata*).

⁹ The CDFW assigns Diegan coastal sage scrub a ranking of S3.1 ("vulnerable in the state due to a restricted range, relatively few populations, recent and widespread declines, or other factors"); maritime succulent scrub is ranked S1.1 ("critically imperiled because of extreme rarity or other factors"). Both are considered threatened and vulnerable to extirpation. (CDFG 2010). Note: At the time the most recent list of vegetation alliances and associations was published, in 2010, the CDFW was still known as the California Department of Fish and Game (CDFG).

especially valuable for their role in the ecosystem, and are easily disturbed or degraded by human activities. The Commission's staff ecologist has determined that these areas meet the definition of an ESHA in Coastal Act Section 30107.5 (**Exhibit 9**, p. 3-4).

The proposed Coastal Campus project would result in the permanent removal of 0.35 acres of Diegan coastal sage scrub ESHA (CSS supporting rare and endangered species) occurring at two locations in the northeastern portion of the development footprint. The removal of the stand of coastal sage scrub falling entirely within the northern development footprint would result in the removal of an occurrence of Nuttall's lotus, a special-status native plant species. These areas are shown in **Exhibit 6b**. The removal or disturbance of coastal sage scrub habitat determined to be an ESHA would be inconsistent with the resource protection requirements of Section 30240 of the Coastal Act, both because the proposed development is not a resource dependent use, and because it does not protect against the significant disruption of habitat values.

San Diego Fairy Shrimp & Vernal Pools

The San Diego fairy shrimp (*Branchinecta sandiegonensis*) is a small freshwater shrimp that inhabits vernal pools (seasonal shallow pools that are typically filled by winter and spring rains between November and May) in coastal southern California and south to northwestern Baja California. San Diego fairy shrimp (henceforth referred to as fairy shrimp) are habitat specialists found in small, shallow vernal pools and ephemeral (lasting a short time) basins with specific water chemistry and temperature conditions. All known occupied localities are below 2,300 feet and are within 40 miles of the Pacific Ocean.

In the vernal pools in which they occur, adult San Diego fairy shrimp are usually observed between January and March, hatching and maturing within a one to two week period, and persisting for about a month prior to reproduction and senescence. The length of the hatching period is dependent on hydrologic conditions, and may be extended during rainier winters. Fairy shrimp eggs are either dropped to the pool bottom or remain in the brood sac until the female dies and sinks. Resting eggs, or "cysts," are capable of withstanding temperature extremes and prolonged drying, and may remain dormant in the soil for several years. Studies have shown that vernal pools and ephemeral wetlands that support fairy shrimp, and occur in areas with variable weather conditions or filling periods (such as southern California), may hatch only a fraction of the total cyst bank (organisms in a resting stage) in any given year. Thus, reproductive success is spread over several seasons.

San Diego fairy shrimp has been listed as endangered on the federal Endangered Species Act list since 1997 due to extensive loss and degradation of habitat from development and urbanization. At the time of listing, FWS estimated that less than 200 of the original 500 acres of vernal pool habitats suitable for fairy shrimp occupation in San Diego County remained. An estimated 70% of the remaining suitable habitat occurs on lands managed by the Department of Defense.

Due to the rarity, sensitivity and importance of vernal pools as well as the fact that these areas support sensitive species, such as the fairy shrimp, the Commission has determined on previous occasions that vernal pools containing San Diego fairy shrimp and/or characteristic vernal pool plant species meet the Coastal Act definition of ESHA. At the time of surveys conducted during

the winters of 2010 and 2011, the SSTC-S site contained 59 vernal pools and ephemeral basins (with a total area of 11.11 acres), of which 45 were surveyed, 26 were observed to support San Diego fairy shrimp (**Exhibit 10**) and 22 were found to support characteristic vernal pool plant species (ICF 2012). There was no correlation between the presence of vernal pool vegetation and the presence of fairy shrimp. The Commission's staff ecologist has stated that seasonal ponds that support characteristic vernal pool plants or the federally Endangered San Diego fairy shrimp are of very high conservation value. (**Exhibit 9**, p. 3).

Potential Effects on ESHA and San Diego Fairy Shrimp; Mitigation

In its consistency determination and Draft EIS, the Navy contends that the San Diego fairy shrimp and vernal pool habitats would not be directly affected by the proposed project due to the fact that all of the vernal pools at SSTC-S are located outside the project footprint. The existing portion of the "Option 2" alignment of the water utility line crosses beneath a ditch connected to vernal pool #10 (**Exhibits 6b, 10**). Replacing this portion of the water line, as initially proposed by the Navy, would require trenching through or drilling beneath the vernal pool extension, with potential adverse effects on San Diego fairy shrimp. In response to this concern, raised by the U.S. Fish and Wildlife Service (USFWS) during its informal consultation, the Navy elected to modify the Option 2 water line by reusing the existing pipeline across the southern portion of the site (i.e., this existing pipe would no longer be replaced with a new pipeline). The consistency determination states:

Focused wildlife habitat assessments concluded that the area is suitable habitat for the Federally-listed San Diego fairy shrimp ... Surveys conducted in 2003, 2010 and 2011 confirmed presence of San Diego fairy shrimp, and one basin (vernal pool 10) is occupied and within the proposed Option 2 alignment of the water line relocation element. The main part of the basin is outside the proposed water line relocation; however, a small drainage feature that heads west toward the beach from basin 10 would be impacted by construction of Option 2 alignment ... During consultation discussions, USFWS ... raised concerns over impacts to fairy shrimp from the proposed directional drilling under vernal pool 10 for Option 2 ... Accordingly, the Navy has decided to remove work on the southern portion of the water line relocation to avoid these impacts.

In response to Commission staff concerns about the adverse impacts to wetland and southern foredune areas from the Option 1 route, the Navy now proposes to implement the Option 2 route, without replacing the existing portions of pipe, and thus avoiding the need to trench or drill within vernal pool habitat.

Although the Navy expects no direct impacts to San Diego fairy shrimp and vernal pool habitat, the construction and future operation of the SSTC-S Coastal Campus could result in a variety of indirect adverse effects due to increased dust, storm water runoff, erosion, sedimentation, and the introduction of new invasive plant species. To minimize indirect impacts during construction and operation, the Navy has proposed several impact minimization and avoidance measures through its Informal Section 7 Consultation with the USFWS. General conservation measures are summarized in Subsection A, above, and listed fully in the USFWS consultation letter (**Exhibit 7**, pp. 12-15); measures specific to the San Diego fairy shrimp include the following:

CM 16. Avoidance and minimization of indirect effects to fairy shrimp-occupied habitat adjacent to the project footprint will occur through BMPs for dust and erosion control as outlined above. In addition, NBC NRO will review specific BMPs (e.g., sediment fencing intended to protect vernal pools) before measures are implemented to avoid potential adverse effects (e.g., altered hydrologic regime) of the BMP and determine whether special post-BMP measures are warranted (e.g., revegetation of areas temporarily impacted). No trenching will occur within vernal pool watershed areas in association with BMPs. Additionally, storm water coming from the project footprint, both during and after construction, will be directed away from occupied basins and their watersheds to prevent contaminants and sediment from flowing off the project footprint and into adjacent habitat. All storm water coming from the project will be captured, directed to storm drains, and prevented from entering vernal pools or their watersheds.

CM 17. To avoid effects to fairy shrimp-occupied habitat, known occurrences within 500 feet of project boundaries will be identified on project demolition and construction plans and, if determined necessary by NBC NRO or the project biologist, occupied habitat will be clearly indicated in the field with markers or exclusion fencing. Known populations and restricted areas will be monitored by the project biologist (familiar with the habitat of species) during construction phases, as determined necessary by NBC NRO. If deemed necessary by NBC NRO, a 100-foot non-disturbance buffer will be established around each vernal pool watershed and exclusion fencing, markers, or BMPs will be established around the non-disturbance buffers to prevent construction-related runoff and sedimentation from entering the pools.

*CM 18. To avoid impacts to vernal pools resulting from unauthorized trespass during construction, operation, and maintenance activities, signs and/or gates will be installed at all locations that could provide potential access to the vernal pool watershed (i.e., dirt access roads or foot paths) prior to the initiation of project construction. The type and placement of signs and/or gates will be determined by NBC NRO. Signs and/or gates will be regularly maintained and remain in place for the life of the project.*¹⁰

With these measures in place, the USFWS concluded that “all potential impacts on the ... fairy shrimp ... will be avoided or reduced to a level of insignificance (i.e., unable to be meaningfully measured, detected, or evaluated)” (**Exhibit 7**, p. 10).

The Commission agrees with the Navy’s conclusion that the project, as currently configured, would avoid direct impacts to San Diego fairy shrimp and vernal pool habitat. In all cases, the limits of the proposed development footprint are more than 100 feet from the vernal pools, a buffer distance that is in conformance with the staff ecologist’s recommendation (**Exhibit 9**, p. 5-6) and past Commission actions, and that would provide some defense against indirect effects if the proposed development were built. The Navy’s proposed conservation measures would also avoid indirect effects on this species and habitat during construction and operation.

¹⁰ “NBC NRO” in this selection stands for “Naval Base Coronado Natural Resources Office.”

As is discussed in greater detail in Subsection I (Water Quality), below, Commission staff had expressed concern that the Navy's approach to storm water management, including the capture, rerouting and infiltration of all or most of the runoff from the proposed development footprint, could have the unintended consequence of altering the hydrologic regimes of the vernal pools in the southern portion of SSTC-S.¹¹ In subsequent discussions, the Navy has clarified that the proposed development would occur outside the drainages of existing vernal pools under most conditions, and that the goal of storm water management at the proposed campus would not be to divert all runoff at the site, but to capture the *additional* runoff resulting from the new development. Based on the information provided, the Commission concludes that the proposed handling of storm water runoff from the proposed project would avoid significant disruption of the San Diego fairy shrimp and its vernal pool habitat.

Southern Foredunes

SSTC-S contains 42 acres of southern foredune habitat on the western, seaward boundary of the site, occurring on either side of the western perimeter fence (**Exhibits 6a, 6b**). The southern foredune community is recognized by the CDFW in the California Natural Diversity Database as a rare natural community of highly limited distribution due to its scarcity and declining status in southern California (CDFG 2010). Southern foredunes have been greatly reduced by urban and other development between Point Conception and the Mexican border; it is estimated that less than 2,000 total acres of this habitat remain in California. Remaining areas of intact southern foredunes are ranked by CDFW as S2.1 ("imperiled, seriously threatened in California"), and are of high priority for conservation.

Given the rarity of dune habitats across the state, the Commission has considered dune plant communities, even those that are significantly degraded, to meet the definition of ESHA, if they retain some connection to the beach or other dune areas, or if they are inhabited by plants or animals that are rare, endangered, or have other special status. In this case, the dunes at SSTC-S, though in places degraded by foot and vehicle traffic and invasive ice-plant, remain largely intact, and together with the dunes directly to the north at Silver Strand State Beach, represent the largest contiguous stretch of dunes remaining on the Silver Strand peninsula and Coronado Island, and the most intact of this habitat remaining in San Diego County (AECOM 2012). The dune system at SSTC-S retains its connection to the beach and provides many important ecosystem functions, including nesting habitat for the federally-listed Western snowy plover, and habitat for rare native plant species, including Nuttall's lotus, Coast woolly-heads, California box thorn, Orcutt's pincushion, and Red sand-verbena (*Abronia maritima*), which are listed as "rare and endangered" species by the CNPS,¹² and the rare globose dune beetle (CDFW 2014b). Based on the rarity of southern foredune habitat in California, the high quality of the habitat and the presence of rare plant and animal species at SSTC-S, and the fact that these resources could easily be disturbed or degraded by human activities or development, the Commission's staff

¹¹ September 17, 2014, correspondence between U.S. Navy and Commission staff.

¹² Nuttall's lotus, Orcutt's pincushion and Coast woolly-heads are CNPS Rank 1B.1 species ("critically endangered in California"), while California box thorn and Red sand-verbena are CNPS Rank 4 species ("limited distribution")

ecologist has determined that the southern foredune habitat at SSTC-S meets the definition of ESHA in the Coastal Act (**Exhibit 9**, p. 4).

Direct Impacts to Southern Foredunes

The proposed project would result in the permanent removal of 0.23 acres of southern foredune habitat, including areas inhabited by Nuttall's lotus and Coast woolly-heads, as a result of the construction of the new northern entryway and access road (**Exhibits 5d, 6d**). The construction of a new right-turn lane on SR-75, within the Caltrans right-of-way on the approach to the northern entrance, would also permanently remove 0.15 acres of southern foredunes that are within the designated critical habitat of the Western snowy plover.

In addition, the installation of a new water line along either the Option 1 or Option 2 routes (*see above*) would require trenching and fill within areas of southern foredune habitat along the western boundary of the site. The initial installation of the pipe would result in the removal of several occurrences of CNPS-listed plant species, including Nuttall's lotus, Coast woolly-heads and Southwestern spiny rush,¹ growing along the water line easement (**Exhibit 6b**). While it is possible that the dune vegetation removed during the pipe installation would eventually recover, future maintenance activities along the water line easement would guarantee some degree of periodic disturbance. At the hearing, the Navy agreed to relocate the water line to one of the alternative routes suggested by the Commission staff in **Exhibit 6e**, which will avoid disturbance of southern foredune ESHA and special status plant species.

The proposed removal and disturbance of southern foredune habitat that has been designated as ESHA by the Commission's staff ecologist, as described above, would be inconsistent with the resource protection requirements of Section 30240 of the Coastal Act, both because the proposed development is not a resource dependent use, and because it does not protect against the significant disruption of habitat values.

Western Snowy Plover

The western side of the dunes at SSTC-S provides breeding and nesting habitat for the Western snowy plover (*Charadrius nivosus nivosus*), a federally-threatened shorebird species. Western snowy plover is a small shorebird that uses sandy beaches for nesting and roosting from southern Washington to Baja California. The estimated population of adult plovers that may breed along the U.S. Pacific Coast has varied between approximately 1000 to 2000 birds over the last 30 years, with approximately 1000 birds breeding along the Baja California coast (USFWS 2007; Thomas et al. 2012). Research has indicated that there has been a general decline the West Coast population of snowy plover over past decades, including a substantial decrease in the abundance of wintering plovers in southern California (USFWS 2007). Among the factors linked to the regional decline in snowy plovers includes predation, beach erosion, encroachment of exotic vegetation and disturbance from recreation. A small breeding population of plovers is known to occur in the foredunes at SSTC-S. Based on surveys from 2011 to 2013, there has been an average of six breeding pairs of plovers, and 20 nests and 13 fledges, per nesting season on the SSTC-S beach and dunes. The locations and outcomes of recent Western snowy plover nests at SSTC-S are shown in **Exhibits 5d and 10**.

As summarized above, the proposed project would result in the permanent destruction of 0.38 acres of foredune habitat associated with the construction of the new northern entrance, and the substantial disturbance of 2.61 acres of habitat due to the installation of the Option 1 water line. However, none of these areas are known to serve as habitat for Western snowy plovers. The southern foredune areas that would be removed or disturbed due to the entrance and water line construction are located inland of the SSTC-S perimeter fence, 100 feet or more from the nearest known nesting site, and are thus not accessible to snowy plovers. Moreover, the USFWS has determined in its informal Section 7 consultation letter that the 0.15 acres of critical habitat that would be removed is not suitable snowy plover habitat:

*Approximately 0.15 acre of plover critical habitat (Subunit CA 55F) will be directly impacted by construction of the new access road in Caltrans ROW along SR-75 (Figure 2). Of the four primary constituent elements (PCEs) outlined in the final critical habitat designation (Service 2012), PCEs 1 to 3 are related to habitat required by the plover for feeding, breeding, and sheltering, and PCE 4 relates to the plover's requirement for habitat with minimal human disturbance for survival and reproduction. The 0.15-acre impact area consists of southern foredune habitat that is vegetated with nonnative ice plant (*Carpobrotus chilensis*) and some coastal sage scrub species, is disturbed by vehicle traffic on SR-75, and does not provide suitable habitat for plovers. Therefore, this area does not currently contain the PCEs of plover critical habitat, although it could be restored to support PCEs.*

In order to mitigate for the loss of this small area of marginal habitat, the USFWS's determination that a formal Section 7 consultation is not necessary is contingent on the Navy agreeing to undertake the following measure:

CM 32. To offset permanent impacts to plover critical habitat, the Navy will restore/enhance 0.15 acres of plover habitat through removal of ice plant along the western SSTC-South boundary (outside of the fence line) within 12 months of the completion of construction activities in plover critical habitat. All ice plant removal will be accomplished during the non-nesting season and will be completed using a work crew with hand tools or machinery (i.e., a bobcat or loader with grapppler attachment).

Based on this USFWS analysis, and on the locations of the directly affected dune areas in relation to known plover habitat, the Commission agrees that the proposed project would not result in direct impacts to the Western snowy plover, and that the proposed ice plant removal and restoration of dune habitat outside of the SSTC-S fenceline has the potential to benefit the local plover population.

Indirect Effects on Western Snowy Plover

Although no direct impacts are expected, increased human disturbance (i.e., noise, lighting, and unauthorized trespass) and predation associated with the construction and future operation of the SSTC-S Coastal Campus could indirectly affect snowy plovers. The USFWS states:

Loud, irregular sounds during project construction may cause plovers to spend more time away from their nests, thereby increasing the potential for eggs to cool and for eggs and chicks to be predated. Artificial lighting during project construction and operation may cause disorientation, startling, disruption of inter-specific interactions, and increased predation of plovers (Longcore and Rich 2014).

Project construction and operation could also...

... provide additional perching habitat (i.e., towers, tall buildings, utility poles, trees, fences) for avian predators (e.g., hawks, falcons and ravens and crows), which may lead to increased plover predation

...increase populations of mammalian and avian predators at SSTC-South by providing supplemental food (through trash)

...increase human disturbance in the plover nesting areas.

With regard to the night-lighting and noise generated by project construction and operation, the USFWS notes:

However, southern foredunes between the project footprint and plover nesting areas along the western fence line are about 6 to 12 feet higher than the plover nesting area and are expected to attenuate much of the noise and light from project construction, operation and maintenance. In addition, project construction, operation and maintenance noise levels reaching the nesting areas are expected to be similar to or less than the relatively high ambient noise levels from ocean surf.

Noise analyses conducted by the Navy during preparation of the DEIS support this conclusion. In order to minimize the potential indirect effects of the construction and operation of the Coastal Campus at SSTC-S, the Navy has agreed to implement the following measures, as summarized in the informal Section 7 consultation:

CM 19. The Navy will distribute educational materials and/or install interpretive panels to inform military and civilian personnel of the sensitive species on SSTC-South and measures in place to avoid effects (e.g., no recreational use of the beach, meaning activities not associated with approved training, is permitted).

CM 20. Construction during the breeding season within 300 feet of plover nesting locations will be avoided to the maximum extent feasible. The nesting season occurs from approximately 1 March through 15 September, but varies depending on species and environmental conditions for each year. The exact timing of construction to avoid the nesting season (when construction will occur within 300 feet of occupied habitat) will be agreed upon by NBC NRO and Service. If construction must occur during the nesting season within 300 feet of occupied plover habitat, NBC NRO, in coordination with the Service, will determine the locations to construct noise and visual attenuation barriers of

plywood 12 feet tall to mitigate any potential temporary noise and visual effects to nearby plover breeding locations. NBC NRO may determine the need for additional noise attenuation and light reduction measures for any building or bunker demolition that may take place during the breeding season.

CM 21. In the event that nighttime construction work is required, prior approval will be required by NBC NRO. Any artificial lighting required will be shielded away from native vegetation communities, beaches, and SR-75.

CM 22. Other methods of reducing light pollution (e.g., dusk-to-dawn sensor activation, low lumen or limited-spectrum lighting) will be applied wherever possible. Light poles and light placement will be constructed at the lowest height possible (considering security constraints) to reduce effects to the surrounding natural resources by reducing raptor perching sites and to reduce light pollution.

CM 23. NBC NRO will review project design features (during the design phase) to ensure that building designs minimize effects to plovers and rails. Design features that prevent raptors and avian predators from perching near sensitive avian species nesting habitat may include the use of anti-perching devices on light poles, rooftops, and other perching locations. Anti-nesting devices will be installed on appropriate structures to prevent prey species from nesting on buildings, which may attract predatory avian species. Additional building design features may include minimizing building heights to reduce bird collisions, altering roof pitch designs to minimize perching, and limiting the number of new light poles or new perching structures. Light poles and light placement will be constructed at the lowest height possible (considering security constraints) to reduce effects to the plover and rail by reducing raptor perching sites and to reduce light pollution.

CM 24. During construction, equipment (such as cranes) that could provide temporary supplemental perches for birds of prey and predatory birds will be staged and stored when not in use at least 500 feet away (inside the project footprint) from habitat occupied by plovers. Equipment staging and laydown areas will be approved in advance by NBC NRO to ensure the areas are far enough away from occupied habitat. The project biologist will monitor construction activities to determine if equipment is providing supplemental perches, and make recommendations to reduce perching opportunities for avian predators.

CM 26. New buildings and structures will incorporate a bird-friendly design to reduce and prevent birds from colliding with buildings. Bird-friendly design features include transparent passageways, corners, atria, or courtyards so that birds do not get trapped; appropriately shielded outside lighting that is directed away from native habitats to minimize attraction to light-migrating songbirds; interior lighting that is turned off at night or designed to minimize light escaping through windows; and landscaping that is designed to keep birds away from the building's façade. Use of non-reflective or opaque glass; external shades (or other devices to reduce glare, transparency, or reflectiveness) on windows; ultraviolet patterned glass; angled glass; and/or louvers can aid in reducing bird collisions. Additionally, night-time lighting will include bird friendly design features such

as shielded lights (to reduce ambient light into nearby native habitats), use of motion detectors, dusk-to-dawn sensor activation and other automatic controls, low-lumen or limited-spectrum lighting, and lighting design that uses shields to prevent light from shining upward into the sky (Sheppard 2011). NBC NRO will be consulted to ensure the minimization measures are incorporated to prevent window strikes.

CM 27. To avoid impacts to plovers resulting from operation of the project (i.e., causal outdoor recreation such as walking or running within occupied plover habitat), the existing gate along the western perimeter fence allowing beach access will remain locked at all times during the plover breeding season except when authorized access is granted.

*CM 28. All proposed planting palettes, landscape designs, and installation of trees will be submitted for review and approval by NBC NRO and Navy Landscape Architect and will use native, drought-tolerant plants appropriate for SSTC-South, NAB Coronado, and NASNI. Invasive plant species will not be included in landscape plantings. A list of suitable landscape plants (including trees) is included in the Landscaping and Installation Appearance Plan Approved Plant List in Appendix H of the Naval Base Coronado Integrated Natural Resources Management Plan (Navy 2013). To reduce the effects of nesting avian predators in trees within the project footprint, there will be a 1:1 ratio of trees removed to trees planted so there is no net increase in the number of trees from current conditions. Trees will not be placed within 300 feet of the western fence line. Trees will be spaced far enough apart so that when full grown their branches will not be touching. Trees will be trimmed or pruned to open up the canopy of the trees to prevent nesting of American crows (*Corvus brachyrhynchos*) and/or common ravens (*Corvus corax*).*

*CM 29. All trash generated from construction, operation, and maintenance of the project will be contained within covered, secured trash bins that are inaccessible to wildlife and emptied on a regular basis and prevented from overflowing. All exposed food waste or trash generated from food products (e.g., wrappers, food containers) will be removed from the site on a daily basis to prevent attraction of predators (e.g., American crows or common ravens and mammalian scavengers such as rats [*Rattus spp.*], raccoons [*Procyon lotor*], and skunks [*Mephitis mephitis*]).*

CM 30. A visual obstruction is necessary to obscure the proposed entry control point on the north end of the site and the vehicles using the deceleration lane from adjacent occupied critical habitat for the plover on Silver Strand State Beach and from adjacent occupied plover habitat at the north end of SSTC-South. Construction of the entry control point will require grading to access SR-75 due to existing topography, slope stability, and the need for suitable vehicle access associated with the entry control point. Pre-construction engineering may indicate that the grading and site preparation itself may create a topographic visual barrier that adequately obscures the entry control point from the adjacent critical habitat for the plover. However, if engineering design for the entry control point does not create conditions that obscure the site from critical habitat for the plover, a permanent stonewall, concrete wall, or earthen berm or screening fence will be

constructed within the project footprint along the west side of the entry gate road prior to the initiation of construction of the traffic and entry gate improvements. The height and length of the wall or fence will be determined by NBC NRO and USFWS. The wall or fence will have anti-perching devices installed on the top to prevent birds of prey from using the wall or fence for perching.

CM 31. During the design phase, NBC NRO will be consulted regarding the exact location of the entry control point. If feasible, the entry control point will be located as far south along SR-75 as possible to reduce the potential for disturbance to plovers within critical habitat from humans and vehicles entering and leaving SSTC-South. To the maximum extent feasible, construction of the new proposed entry control point and adjacent security fence will take place outside of the plover nesting season (which generally occurs from 1 March through 15 September, but this may vary slightly from year to year).

The Commission staff has expressed concern to the Navy that CMs 20 and 31 (above), would not prohibit construction activities within 300 feet of occupied snowy plover habitat during the breeding season, if such a restriction were deemed infeasible. In response, the Navy has clarified that the only construction activity with the potential to occur within 300 feet of plover nesting sites is the improvement of the northern entrance; all other projects, including installation of the water line, would occur more than 300 feet from nesting sites and/or outside the breeding season. The Navy has successfully used the proposed sound and visual barriers to protect snowy plovers during previous construction projects, and has through its management policies maintained and enhanced the breeding population of plovers at NBC installations over the past decade.¹³

The Commission's staff ecologist has reviewed this information and agrees that properly designed and sited barriers would attenuate much of the noise and visual disturbance associated with constructing the entrance improvements (J. Dixon, pers. comm.). He has also noted that the entrance construction would take place on a relatively small area of the SSTC-S site, and would potentially affect only a relatively small number of plover breeding sites (**Exhibit 10**). The Commission thus concludes that the plover conservation measures, in combination with the biological monitoring requirements of CMs 1 and 7 (**Exhibit 7**, p. 12-13) and USFWS oversight, would minimize the potential for indirect effects on the Western snowy plover from the proposed project.

Conclusion

At the hearing, the Navy described its efforts to select a project location and design a project footprint that would avoid impacts sensitive species and habitat to the maximum extent practicable, and indicated that no alternative site within NBC could meet the Navy's needs for the Coastal Campus with a lesser impact on environmental resources. The Navy has also agreed to provide at least 3:1 mitigation for the direct impacts to Nuttall's lotus through restoration of 7 acres of appropriate habitat. The habitat restoration will consist of the eradication of ice-plant, which is expected to facilitate the recovery and spread of native southern foredune vegetation, including Nuttall's lotus.

¹³ October 29, 2014, correspondence between U.S. Navy and Commission staff, "#3 & #9 Plover habitat."

For the reasons discussed above, the Commission finds that the proposed development is not fully consistent with Section 30240 of the Coastal Act, because it cannot be considered a “use dependent on the resources.”

The proposed project’s permanent and/or temporary use of multiple ESHAs, including extensive areas occupied by Nuttall’s lotus and other CNPS-ranked rare and endangered plant species, 2.8 acres of southern foredunes supporting Western snowy plover, and 0.35 acres of Diegan coastal sage scrub, is not a use allowable within such habitat, and this use and the use of adjacent areas would not protect such habitat. However, with the Navy’s proposed mitigation in place, the Commission finds that the proposed project is consistent to the maximum extent practicable with the environmentally sensitive habitat policy of the CCMP (Coastal Act Section 30240).

D. WETLANDS

Coastal Act Section 30233 states:

(a) The diking, filling, or dredging of open coastal waters, wetlands, estuaries, and lakes shall be permitted in accordance with other applicable provisions of this division, where there is no feasible less environmentally damaging alternative, and where feasible mitigation measures have been provided to minimize adverse environmental effects, and shall be limited to the following:

...

(4) Incidental public service purposes, including but not limited to, burying cables and pipes or inspection of piers and maintenance of existing intake and outfall lines.

...

(c) In addition to the other provisions of this section, diking, filling, or dredging in existing estuaries and wetlands shall maintain or enhance the functional capacity of the wetland or estuary.

Section 30121 of the Coastal Act defines a wetland as follows:

"Wetland" means lands within the coastal zone which may be covered periodically or permanently with shallow water and include saltwater marshes, freshwater marshes, open or closed brackish water marshes, swamps, mudflats, and fens.

In addition, Section 13577(b)(1) of the Commission’s Administrative Regulations (Title 14, Division 5.5) provides:

Wetland shall be defined as land where the water table is at, near, or above the land surface long enough to promote the formation of hydric soils or to support the growth of hydrophytes, and shall also include those types of wetlands where vegetation is lacking and soil is poorly developed or absent as a result of frequent and drastic fluctuations of surface water levels, wave action, water flow, turbidity or high concentrations of salts or other substances in the substrate. Such wetlands can be recognized by the presence of surface water or saturated substrate at some time during each year and their location within, or adjacent to, vegetated wetlands or deep-water habitats.

Wetland Delineations

The Navy performed wetland delineations at SSTC-S as part of a biological resources inventory completed in 2004 (Saucedo-Ortiz 2004), and revisited the delineations in the preparation of the Draft EIS. The Navy's consultants followed the procedural guidelines and criteria outlined in the U.S. Army Corps of Engineers Wetlands Delineation Manual. Several wetland areas were identified within SSTC-S (**Exhibit 6a**). The largest tract of wetlands on site, consisting of Southern coastal salt marsh and several small vernal pools, occurs in and adjacent to YMCA Camp Surf in the southwestern corner of the site. Other substantial wetland areas are located in the southeastern quadrant of the site, including numerous vernal pools, two areas of coastal salt marsh, and a few small patches of freshwater marsh. In total, the Navy's surveys identified 20.70 acres of coastal salt marsh, 11.11 acres of vernal pools, and 0.16 acres of freshwater marsh on the SSTC-S.

The Commission staff has advised the Navy that Coastal Act-defined wetlands may be more extensive than Army Corps-defined wetlands, and requested that the Navy identify any differences in the wetland delineation that would result if a Coastal-Act ("one parameter") definition were applied.¹⁴ The Navy responded as follows (in relevant part):

A one parameter wetland delineation has not been done for SSTC-S that we are aware. The one parameter wetland delineation may expand the area mapped as wetland, but it would not include any of the area within the proposed footprint. The entire proposed footprint is within disturbed or upland habitat. Standing water or wetland vegetation is not present to classify the proposed footprint as one parameter wetland. Hydric soils, the third parameter, are not considered present on site ... The only exception to this is the water line that runs through USACE wetlands (Coastal and Valley Freshwater Marsh). This is not USACE jurisdictional, as the marsh was only present due to a leaky pipe which was fixed in fall 2013. This would likely be considered a one parameter wetland. However, this area is no longer impacted, as the project has been revised to avoid new pipe within this area, so no development there is anticipated.

The Commission's staff ecologist agrees that, while a wetland delineation based on the Coastal Act definition may have identified additional wetland areas, these areas would likely occur in the same general area (i.e., the low-lying southern portions of SSTC-S) as the Army Corps-defined wetlands rather than in the proposed development footprint (**Exhibit 9**, p. 2-3). The freshwater

¹⁴ September 5, 2014, correspondence between U.S. Navy and Commission staff.

marsh referenced in the Navy's response, though not an Army Corps jurisdictional wetland, was nonetheless correctly identified as a wetland in the Navy's analysis. The staff ecologist has also noted that the small stand of Southwestern spiny rush (*Juncus acutus*), a plant often associated with salt marsh habitats, occurring in the extreme northwestern corner of the site within the proposed Option 1 water line easement (**Exhibit 6b**), likely represents a non-wetland occurrence of this species based on the surrounding dune topography and well-drained soils (J. Dixon, pers. comm.).

At the hearing, the Navy agreed to modify the water line route to match one of the alternatives suggested by the Commission staff in **Exhibit 6e**. These alternatives avoid all wetland areas. The Commission's ecologist has concluded that additional wetland delineations using State criteria would be necessary only for a water line route near the previously-identified, federal wetlands in the southern areas of the site (**Exhibit 9**). Thus, with the adoption of a modified water line configuration as shown in **Exhibit 6e**, no additional wetland delineations would be necessary.

In conclusion, the Commission finds that the project would avoid the diking, filling or dredging of coastal wetlands, and is thus consistent with the wetland policies of the CCMP (Coastal Act Section 30233).

E. HAZARDS

Coastal Act Section 30253 states in part:

New development shall do all of the following:

(a) Minimize risks to life and property in areas of high geologic, flood, and fire hazard.

(b) Assure stability and structural integrity, and neither contribute significantly to erosion, geologic instability, or destruction of the site or surrounding area or in any way require the construction of protective devices that would substantially alter natural landforms along bluffs and cliffs.

Though not the legal standard of review in this case, the City of Coronado's certified Local Coastal Program (LCP) provides locally-relevant guidance with regard to coastal erosion hazards:

LCP Policy E.4: *Require that any permanent building, or other structure proposed for construction be set back from an eroding beach coastline a distance sufficient to assure that the development will not be threatened by natural erosion processes during the lifetime of the structure without requiring shoreline protection structures. The builder, at the discretion of the City, shall provide a certification by a civil engineer that the proposed construction site meets this criteria [sic].*

The Navy's consistency determination does not examine whether the proposed project would place life or property in areas of high geologic, flood, or fire hazard risk. However, the coastal

location, relatively low elevation, and highly erodible soils of the SSTC-S raise the question of whether the proposed development at this site would be at risk from coastal erosion and flooding during its design life, and whether the stability and structural integrity of the development can be assured into the future without reliance on shoreline protective devices.

Low-lying coastal areas in San Diego Bay region, including portions of Imperial Beach, Coronado, and Silver Strand peninsula, are currently vulnerable to flooding during winter storms when heavy rainfall, storm surge and high waves coincide with high tide conditions. This vulnerability is evident in flood zone maps produced by the Federal Emergency Management Agency (FEMA) (**Exhibit 11**) and tsunami inundation maps produced by the State of California (**Exhibit 12**).¹⁵ The sandy ocean shorelines of Silver Strand, itself a sand spit deposited over time by the net northward sediment transport in the Silver Strand Littoral Cell, are also highly vulnerable to coastal erosion. Since the damming of the Tijuana River in 1937 and the loss of the greater part of the sediment supply to the littoral cell, along with decreased rates of artificial beach nourishment in recent decades, significant beach recession has occurred at the Tijuana River delta, Imperial Beach, and southern Silver Strand (Flick 1993; Hapke et al. 2006; U.S. Navy 2010). Over the last several decades, estimated rates of beach retreat at Imperial Beach and Silver Strand locations near SSTC-S range from 3 to 6 feet per year. Rising sea level associated with global warming will increase the exposure of at-risk areas to coastal flooding and erosion hazards, and over time extend the area of vulnerability inland.

Sea level rise

Projections of future sea level rise for a given location vary greatly depending on assumptions made about future greenhouse gas emissions, the magnitude of ocean warming and ice sheet loss, and local or regional factors such as land subsidence or uplift. Regionally-specific sea level rise projections for the California coast south of Cape Mendocino are contained in a 2012 National Research Council report examining sea level along the west coast (NRC 2012), and an updated state sea level rise guidance issued in 2013 by the Coastal and Ocean Working Group of the California Climate Action Team (CO-CAT). The 2013 CO-CAT report, reflecting the updated science provided in the NRC 2012 report, projects sea level along the California coast to rise 2 to 12 inches (4 – 30 cm) by 2030, 5 to 24 inches (12 – 61 cm) by 2050, and 17 to 66 inches (42 - 167 cm) by 2100. The ranges in these projections are based on a range of modeling results and low, medium and high future greenhouse gas emission scenarios. The State Coastal Conservancy and the State Lands Commission have adopted the use of 55 inches (140 cm) of sea level rise for 2100 which is consistent with the average of the models of sea level rise for 2100 based on a high future greenhouse gas emission scenario.

Throughout the first half of the 21st-century, sea level rise alone is not expected to cause significant flooding, inundation, or erosion; rather the highest probability and most damaging events likely will take place when increasingly elevated sea level occurs simultaneously with high tides, storm surge and large waves (e.g., during winter storms, El Niño events). Between 2050 and 2100, the effects of sea level rise alone (flooding and inundation) and the combined

¹⁵ The FEMA flood zone map is reproduced in the Draft EIS as Fig. 3.5-2; the tsunami hazard zone map is reproduced as Fig. 3.2-3.

effects of sea level rise and large waves (e.g., damage to coastal structures, cliff erosion, beach loss) are projected to have much greater impacts.

To comply with Coastal Act Section 30253 development must be planned, located, designed and engineered for the changing water levels and associated impacts that might occur over the life of the development. In addition, project planning should anticipate the migration and natural adaptation of coastal resources (beaches, dunes, wetlands, etc.) due to these future sea-level rise conditions in order to avoid future impacts to those resources from the new development. At SSTC-S, the proposed development would be located inland of an intact coastal dune system, that has been determined by the Commission to support ESHA (*see* Subsection C, above), and which, under natural conditions, would be expected to migrate inland with increasing sea level. If the Coastal Campus project, or any future shoreline protective device needed to protect the development, has the potential to limit the natural migration of the dune system and result in its eventual loss due to erosion, it could not be found consistent with Section 30253 in that it would contribute to the destruction of the site and surrounding area.

Topography of the Coastal Campus Site

The topography of southern Silver Strand is relatively flat, with elevations rarely exceeding 15 feet above mean sea level (MSL). The northern portion of the SSTC-S, where much of the proposed Coastal Campus development would be located, occurs on some of the highest ground in the area, a low plateau at about 30 feet (9 meters) above MSL. In contrast, the southern portion of the site, including the circular area currently occupied by the NRRF antenna array that is also slated for development, sits at an elevation of approximately 10 feet (3 m) above MSL, and includes numerous small depressions forming ephemeral wetlands and vernal pools during the wet season. The western edge of SSTC-S is bounded by a system of coastal dunes, which provide a degree of natural flood protection to the SSTC-S site, but are subject to erosion from prevailing coastal winds, surf, storm surge, and military training maneuvers. (DEIS, p.3.2-1; U.S. Navy 2010).

SSTC-S Vulnerability to Coastal Flooding, Erosion & Sea Level Rise

In the Draft EIS, the Navy evaluates flooding hazards at SSTC-S as follows:

Although SSTC-South is outside the 100-year flood zone, some off-SSTC-South areas planned for traffic and utility improvements, are within the 100-year floodplain and are subject to flooding during a 100-year storm event (Figure 3.5-2). SSTC-South is susceptible to localized flooding and has been known to contain seasonal pools created by storm water runoff due to its low-lying, flat terrain; poor drainage; and high water table.

However, the Navy acknowledges that military properties are exempt from flood zone mapping, and that the location of SSTC-S outside the mapped 100-year flood zone does not necessarily reflect the actual flooding risk that presently exists at the site.¹⁶ While the relatively high elevations (about 30 feet above MSL) of the northern portion of SSTC-S are almost certainly above the 100-year flood zone, the lower-lying southern portion of the site, including the area

¹⁶ September 17, 2014, correspondence between U.S. Navy and Commission staff.

around the NRRF Wullenweber antenna array, may be vulnerable to flooding under certain conditions. These southern areas are currently at risk of flooding during a large tsunami event, as indicated by the tsunami inundation maps produced by the California Emergency Management Agency (**Exhibit 12**).

As discussed in Subsection I (Water Quality), the Navy will implement a variety of measures to capture, reroute, and infiltrate storm water runoff (**Exhibit 16**), and in the Draft EIS, the Navy indicate that these measures would be adequate to handle a 100-yr storm event:

By successfully complying with these measures, runoff during construction and postconstruction operations would be minimized and 100-year storm flows would be properly conveyed without impeding or redirecting flows that would potentially harm life or property. By incorporating these design standards, no significant impacts would occur with implementation of features of Alternative 1.

However, the Navy does not address if, and under what circumstances, the lower-lying portions of SSTC-S would become vulnerable to coastal flooding, nor what measures would be necessary to mitigate this hazard.

Another deficiency of the Navy's DEIS analysis is the failure to evaluate hazards that may arise over the life of the Coastal Campus development from future sea level rise and shoreline erosion and retreat. The National Oceanic and Atmospheric Administration (NOAA) has developed a sea level rise visualization tool ("NOAA SLR Viewer") to demonstrate the potential of various levels of sea level rise to effect coastal areas. **Exhibit 13a** shows the output from this tool in the vicinity of SSTC-S at high tide (A) under present conditions, (B) with 3 feet of sea level rise, and (C) with 6 feet of sea level rise, respectively. Under present conditions, several of the existing pools and wetlands in the southern portion of the site are highlighted as "low lying areas" potentially at risk of flooding. With three feet of sea level rise, these at-risk areas have expanded toward the development footprint. With six feet of sea level rise, corresponding to "high emissions" scenarios for the year 2100, much of the southern portion of the site – including a portion of the development footprint – could be inundated. The NOAA SLR Viewer does not take into account higher frequency sea level variability due to storms, El Nino events, or high wave conditions. Another set of future flood risk projections, developed for the state of California, illustrates how storm conditions could amplify the potential for flooding under future sea level rise (Heberger et al. 2009) (**Exhibit 13b**).¹⁷ Under these projections, which assume 55 inches (4.6 feet) of sea level rise in combination with a 100-year storm, the area of potential inundation at SSTC-S is similar to that shown in the NOAA SLR Viewer with 6 feet (72 inches) of sea level rise (**Exhibit 13a**).

These sea level rise projection tools make a number of unrealistic assumptions, most notably that present-day topographic features will remain fixed, and are not designed to substitute for robust, site-specific analysis. At SSTC-S, sea level rise is likely to exacerbate on-going beach erosion

¹⁷ Coastal flood and erosion hazard zone maps associated with the Pacific Institute sea-level rise report (Heberger et al. 2009) are available at http://www2.pacinst.org/reports/sea_level_rise/hazmaps.html.

and shoreline retreat, and the sea level rise projection tools may thus underestimate future hazards. Nonetheless, these simple tools demonstrate the potential for sea level rise to contribute to coastal flooding and erosion hazards within the proposed development footprint, and the need for detailed analysis of these hazards over the design life of the project. It is also worth noting that the southern portion of the development footprint is presently within a tsunami hazard zone (**Exhibit 12**), and that future sea level rise would only expand the areas at risk of inundation during a tsunami.

Information submitted by the Navy in response to questions from Commission staff has only partially addressed the potential for future flooding and erosion at SSTC-S. In an e-mail dated October 29, 2014, the Navy provided maps of projected inundation (using the NOAA Sea Level Rise Viewer) with three to four feet of sea level rise occurring by 2083, a timeframe which the Navy indicates would exceed the design life of the Coastal Campus. No flooding occurs within the development footprint under either of these projections. However, as noted above, the NOAA Viewer projects future water levels based on current mean high high tide alone, and does not take into account extreme high tides, storm surges, El Niño events and other factors which will lead to brief or extended periods of much higher water levels, independently of sea level rise. Crucially, the NOAA Viewer also neglects future shoreline erosion, which will likely exacerbate future flood hazards at this site.

In a November 6, 2014 e-mail, the Navy provided staff with additional information on the Department of Defense's efforts to plan for and adapt to sea level rise (DoD 2014), along with a link to a detailed technical study of potential sea level rise impacts at Camp Pendleton and Naval Base Coronado (Chadwick et al. 2014). The results of this study appear to provide additional evidence that coastal flooding and erosion associated with sea level rise could threaten portions of the Coastal Campus development in the future, and emphasize the need for a site-specific analysis at SSTC-S.

At the hearing, the Navy reiterated its argument that the proposed project would be safe from inundation through 2083 with an assumed 3 feet of mean sea level rise (representing a "moderate" scenario for future sea level rise, but neglecting the effects of erosion or episodic high water levels), and presented evidence that the project site at SSTC-S encompasses the only large, minimally-developed, and relatively high elevation area remaining within NBC, and thus represents the least vulnerable feasible location on which to construct the Coastal Campus. The Navy also stated that shoreline armoring is not a part of the proposed project, and that, at this time, it has no plans for shoreline armoring in the future. The Navy also acknowledged that any future proposal for shoreline armoring at the project site would require federal consistency review by the Commission.

Based on this information, the Commission finds that the proposed project is consistent with the hazards policies of the CCMP (Coastal Act Section 30253).

F. SCENIC AND VISUAL RESOURCES

Coastal Act Section 30251 states:

The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas such as those designated in the California Coastline Preservation and Recreation Plan prepared by the Department of Parks and Recreation and by local government shall be subordinate to the character of its setting.

Although not the standard of review in this case, the visual resource policies of the City of Coronado's certified LCP can provide context, since the NBC installations where the proposed project would be located are nominally within the Coronado city limits.

LCP Policy B.6: *Maintain high standards for visual aesthetics and preserve these scenic qualities as recreational resources.*

LCP Policy H.2: *Require that permitted development be sited and designed to safeguard existing public views to and along the ocean and bay shores of Coronado, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas.*

LCP Policy H.5: *Reaffirm the Scenic Highway Element of the City's General Plan which designates the Silver Strand and San Diego Coronado Bay Bridge portions of State Highway 75 as Scenic Highway, and the Scenic Highway Modifying Chapter of the City's Zoning Ordinance which regulates land use adjoining Scenic Highways.*

LCP Policy H.7c: *Require that development in the entire community generally be compatible in height and bulk with existing development to preserve the scale and character of the community.*

Existing Views

Views to and along the shoreline at SSTC-S are available from a variety of public vantage points south, east, and north of the site. However, due to the size (approximately 1.5 miles long, 0.4 – 0.6 miles wide in most places) and topography of the site (see below), views of the ocean from eastern vantage points are very limited (**Exhibit 15**, p. 3-6). Thus, the most significant shoreline views in the immediate vicinity SSTC-S are from the public beaches north and south of the site and from southbound SR-75, approaching the training complex from the north.

Existing views at the site encompass a mix of natural and man-made features. Natural features include flat, low-lying grassland, marsh, and scrub plant communities, a handful of old, planted cypress trees in the more developed portions of the site, and the coastal dune system along the seaward margin. Most existing buildings and structures are located in the northern half of the

site, and due to their relatively low heights, generally do not present significant visual barriers (**Exhibits 3, 4, 15**). The most notable exception to this rule is the decommissioned NRRF and its Wullenweber Antenna Array, consisting of a 1200-foot diameter concentric ring of 100-foot tall poles, with a 12,000 square foot control building at the center, located on the southern portion of the site (**Exhibits 3, 4, 15**, p. 2, 6-9). The antenna array is the most prominent visual feature of SSTC-S from distant vantage points due to its height, and from the neighborhoods and beaches of Imperial Beach due to proximity; however, most of the array is slated for removal prior to the construction of the Coastal Campus. Other prominent features include the 700 foot long Building 99 bunker and two other historic batteries (Bldg. 98 and Bldg. 100) on the northern portion of the site (**Exhibit 3**). Though the batteries are approximately 45-feet tall, they are covered with earth and vegetation, and more closely resemble low hills than man-made structures (**Exhibits 4, 15**, p. 3, 5). The northeastern boundary of the site along SR-75 is bordered by a mile-long earthen berm (approximately 25 feet in height) that obstructs most views across the northern portion of the site from the east, including from the SR-75 and the Bayshore Bikeway (**Exhibit 15**, p. 4).

The Silver Strand Highway (SR-75) is a state designated Scenic Highway providing views of the coast along portions off its length, including the segment just to the north of SSTC-S. Drivers, bicyclists or pedestrians approaching SSTC-S from the north have relatively unobstructed views of the coastal dunes and shoreline, with existing trees and structures on the site (most prominently the antenna array) and developed areas of Imperial Beach in the background (**Exhibit 15**, p. 2). As one nears the northern boundary of the SSTC-S, the highway bears east, and the foreground view becomes dominated by the site perimeter fence and the beginning of the berm, with the Building 98 battery, trees, and a handful of existing structures in the background, while views of the coastal dunes and ocean gradually diminish (**Exhibit 15**, p. 3). The roadside berm obstructs all views of the coast from the east across SSTC-S from just south of the northern entry to a point about mid-way down the length of the site. Views across the southern portion of SSTC-S from SR-75 and the Bikeway are relatively unobstructed, but the width of site and the western dunes ensure that the ocean is visible only on the horizon (**Exhibit 15**, p. 5-6). Looking to the northwest, trees and a few structures (most notably the Building 99 bunker) are visible in the distance (**Exhibit 15**, p. 7); to the west and southwest, the dominant structure is the antenna array (**Exhibit 15**, p. 6).

The Silver Strand shoreline adjacent to SSTC-S is publically-accessible from Silver Strand State Beach to the north and Imperial Beach to the south. At present, views along the shoreline from these vantage points are relatively open, containing a mix of natural and man-made features. Looking southward from Silver Strand SB, the foreground is dominated by the beach, dunes and ocean, with some existing SSTC-S development, including the antenna array, visible in the background (**Exhibit 15**, p. 1-2). Viewshed features are similar looking northward from Imperial Beach city beaches, though the antenna array is much more prominent (**Exhibit 15**, p. 9).

Effect of Proposed Project on Views

The proposed Coastal Campus project would place approximately 1.5 million square feet of new facilities at SSTC-S, including 24 major buildings or structures, and convert the northern half of the site to a heavily-developed campus. All new structures, with the exception of a 120-foot high

parachute drying tower, would be 45-feet tall or less in order to match the maximum height of the existing development. Although the Navy has not provided a detailed site plan, the proposed project footprint would, for the most part, concentrate new development on the northern portion of SSTC-S (**Exhibits 5a, 5b**).

In its consistency determination, the Navy summarizes the proposed project's effects on scenic resources as follows:

The existing visual setting of SSTC-S would change as a result of the proposed project but the buildings would not obstruct any scenic public viewsheds. The Coastal Campus would modify viewsheds from SR-75, the Bayshore Bikeway, the Coronado Cays, and Silver Strand State Beach ... It would create a more concentrated visual appearance, including increased nighttime lighting conditions, primarily from southbound SR-75 approaching the north gated entry control point. However, viewshed modifications are not anticipated to be perceived as substantial, dramatic, adverse, or controversial. SSTC-S is currently used for military activities and consists of 548 acres of federal-owned military property.

...

Most construction activities would be visible to military and government personnel working on SSTC-S, boaters transiting near the project area, and from multiple view corridors (SR-75, Coronado Cays, Imperial Beach residents near the southern boundary, YMCA Surf Camp and IB Pier). Construction activities for the traffic, access and utilities will be visible to the general public on SR-75 and within the City of Imperial Beach. However, construction activities would be temporary. After construction, the project would be visually consistent with existing buildings in the foreground and adjacent areas.

The Navy also concludes that the project would be visually-compatible with its surroundings due to design features:

Design of the buildings would complement the appearance of surrounding areas by including:

- *Context-sensitive architectural treatments applied consistently throughout the development.*
- *Low reflectivity building materials in natural, earth-tone colors.*
- *Shielding of permanent outdoor lighting that limit light trespass and ambient pollution to achieve dark sky compliance to the extent possible. Additional methods to reduce light pollution, such as dusk-to-dawn sensors, low-lumen or limited spectrum lighting applied as possible and light poles at lowest height possible considering security constraints;*
- *Context- and water-sensitive landscape treatments, including visual buffers such as earthen berms, vegetated buffers, screening trees, and right-of-way landscape improvement along public-facing areas*

With regard to the potential addition of structures at NAB and NASNI under Alternative 3, the Navy states:

Further, modification to views at NAB Coronado and NASNI would not be substantial as those base locations are currently characterized as nearly built out. The addition of one or two new facilities at these locations would not be a change in character or perceptible to the average viewer.

The Navy's assessment of the project's visual impacts are largely echoed by a visual review conducted by the California Department of Transportation , which evaluated visual changes along SR-75, a State Scenic Highway (Caltrans 2014a). In this memo, Caltrans states:

The height of the proposed structures would be consistent with the profile of the existing buildings; however, the location and number of buildings will increase the visibility of facilities from southbound SR-75. The design and appearance of all structures would fit the visual setting (character) and would be 'attractive, landscaped, and receive proper maintenance', in keeping with NBC policies and current practice. The view shed modifications are not anticipated to be perceived as substantial, dramatic, adverse, or controversial, and not result in significant adverse visual impact.

...

In addition, the post-construction conditions of SR-75 would continue to comply with the five (5) legislatively required elements for official scenic highways under Section 261 of the Streets and Highways Code.

Comment letters submitted by the City of Coronado on the Navy's Draft EIS and the Commission's federal consistency review (**Exhibit 14**) provide a counter-argument to the Navy's conclusion that the visual impacts of the proposed project would be insignificant. From the City's perspective, the number, volume and height of the new buildings, and the overall mass of the development, would represent a significant change from existing conditions and would not, as proposed, be visually compatible with its physical surroundings or the City's design guidelines. The City's comment letter on the DEIS includes the following points:

- The proposed project would greatly increase the bulk, mass and height of development in the northern portion of SSTC-S, and would be particularly visible from southbound SR-75. The entire project should be re-designed to be architecturally- and environmentally-sensitive and compatible with the project area and surroundings.
- Although the City does not have direct land use authority over the federal lands of SSTC-S, the proposed project is located in the Wildlife Preserve and Scenic Highway Overlay zones of the City's Land Use Plan (LUP), which include regulations designed to protect the aesthetic characteristics of land within the zones. The Navy should design the Coastal Campus in conformance with design guidelines for these zones, and submit conceptual plans to the City's Design Review Commission for review and comment.

- The Navy should analyze alternatives to the 120-foot high paraloft tower that would reduce visual impacts, such as placing the building partially below grade, redesigning the tower to be an “open” structure (allowing some visual transparency), or relocating it to the NAB where taller structures presently exist.
- The proposed modifications the SSTC-S northern entrance would include the addition of a new roadway, security gate, sentry building, lighting, traffic signal, and other structures which would change the visual appearance of the area and result in new night-time visual intrusions, especially headlight glare in the direction of the Coronado Cays neighborhood. These potential adverse effects should be analyzed and mitigated.

Analysis

It is clear that construction of the Coastal Campus would substantially alter the visual appearance of the SSTC-S, and would replace many of the natural aesthetic qualities of the site with a man-made, built environment. However, under the Coastal Act’s visual resources policy, the Commission does not simply consider whether a development would change the aesthetics of a site, but whether the new development has been sited and designed to protect public views to and along the ocean, to minimize alteration of natural landforms and be visually compatible with the character of the surrounding area.

On one hand, much of the proposed Coastal Campus development would be clustered in the northern portion of the SSTC-S and set back from the edges of the site, thereby taking advantage of the size of the parcel to reduce visual impacts, maximize the shielding effects of the existing berm on the northeastern site boundary, and leave open much of the southern portion of the site. This broad-scale siting decision would protect views to the west from SR-75 and the Bayshore Bikeway along the southern portion of SSTC-S, and limit the project’s intrusion into views along the shore from nearby public beaches.

The Commission agrees with the Navy’s conclusion that the earthen berm would shield all but the tallest proposed structures from the view of SR-75 and the Bikeway along the northeastern portion of the project (**Exhibit 15**, p. 4), and that changes to the coastal view from the highway along the southern portion of SSTC-S would be minor due to the large distances between potential vantage points and the new structures (**Exhibit 15**, p. 5-7). Similarly, views to the coast from street ends in the northern neighborhoods of Imperial Beach would not be substantially degraded due to the distances involved and the presence of existing concrete walls separating the neighborhoods from the military installation (**Exhibit 15**, p. 8). The proposed development would be visible to beach-goers looking northward from Imperial Beach (**Exhibit 15**, p. 9) or southward from Silver Strand State Beach (**Exhibit 15**, p. 1-2), but due to the distances involved, and the planned setbacks from the beach (at least 400 – 600 feet), it would not obstruct views along the shoreline. At worst, new structures would be visible in the distance, but the more proximal inland views would be protected by the existing coastal dune system.

The trade-off of the proposed siting of the Coastal Campus is that the development would be highly visible from northern vantage points, in particular to viewers travelling southward on SR-75 and the Bayshore Bikeway. **Exhibit 15** (p. 3) illustrates how the proposed project would modify the view from southbound SR-75 near the northern entrance to SSTC-S. At present, the

view contains a handful of structures, including the natural-seeming Bldg. 98 battery on the left, which is softened by clusters of trees and the visible horizon; post-project, these natural visual elements would be largely replaced by a solid mass of buildings. The 120-foot tall paraloft tower and a large structure composed of scaffolding on the right would be particularly obtrusive. However, even at present, the shoreline itself is not visible from this vantage point, and the ocean is only visible at the most distant horizon. Thus the potential effects of the project on views *to the ocean* are a relatively minor.

In the absence of specific site plans, it is difficult to evaluate whether an alternate arrangement of buildings and structures would reduce the visual impacts of the proposed project. However, the Commission concludes that, in general, the proposed concentration of development in the northern portion of SSTC-S would protect most views to and along the ocean and minimize the alteration of natural land forms. The exception is the view to the south from SR-75 and the bikeway just north of SSTC-S, which would be substantially altered by the proposed project. In this instance, the adverse visual impacts could be minimized by eliminating, redesigning, or relocating the most obtrusive structure planned for the site, the 120-foot paraloft tower. Commission staff has asked the Navy whether the parachute tower could be relocated, for instance to a previously-developed installation that contains other tall structures. The Navy's initial response indicated that an offsite location would not meet the NSWC's operational needs, but that the "Navy intends to locate that tower to minimize its visual impact to the greatest extent feasible, recognizing that it would be a noticeable feature on the landscape."¹⁸ Subsequent correspondence from the Navy, dated October 31 and November 6, 2014, provided details on the operational and logistical considerations in siting the paraloft tower. In essence, the paraloft tower is just one of several integrated facilities needed to support Navy SEAL training and operations at NBC. Relocating the tower to another installation (e.g., NAB) would create significant logistical complications, reduce the efficiency of SEAL activities, and create new safety issues for parachuting operations. Siting the paraloft tower elsewhere would also create additional daily trips on SR-75 by Navy personnel travelling between SSTC-S and NAB; in the Navy's words, "personnel would need to drive up State Route 75 to NAB numerous times per parachute" operation. Thus, an off-site location for the paraloft tower has the potential to contribute to already significant traffic problems along SR-75, and to result in conflicts with other Coastal Act policies, including those protecting public access (Sections and requiring that new development minimize vehicle miles traveled and energy consumption (Section 30253(d))). The Navy has also indicated that it would examine on-site alternatives for siting the paraloft tower in order to minimize its visual impact, stating:

Within the Coastal Campus site itself, the Navy will look to locate this facility in the optimal location to allow the existing topography to conceal the maximum amount of its profile, within the extent practicable for operational and other environmental impact concerns.

¹⁸ September 17, 2014, correspondence between U.S. Navy and Commission staff.

Based on these considerations, the Commission concludes that it would be infeasible to locate the paraloft tower at an alternative site, and that the Navy will take steps to minimize the tower's visual impact during facility siting decisions.

As discussed above, the clustering of Coastal Campus development would protect most views to and along the coast, and as a general matter, minimize the visual impacts of the project.

However, the Commission's ability to evaluate the visual compatibility of the project with its surroundings is hampered by the early stage of the Navy's planning process and a relative paucity of available information. The Navy has not yet finalized siting or design decisions for the individual MILCON projects that would comprise the Coastal Campus, and notes in its November 6, 2014, correspondence on this issue that each project may be constructed by separate architectural, engineering and construction contractors, and, by implication, may have different design features. Naval Base Coronado is "in the process of procuring a site specific Installation Development Plan for [the] Coastal Campus." As a result, detailed plans and/or simulations of individual buildings and structures are not yet available, and the development simulations provided by the Navy (included in **Exhibit 15**) contain few architectural details. With regard to building design, the Navy proposes to incorporate several features, including "context-sensitive" architecture and landscaping, low-reflectivity building materials, and light-pollution reduction measures, into the Coastal Campus project in order to improve its visual compatibility with its surroundings. The Navy's recent correspondence also provided excerpts from NBC's Installation Appearance Plan (IAP), which contains broad design guidelines that would help ensure some consistency among building styles at the Campus.

At the hearing, the Navy committed to sharing the designs and building parameters of individual facility construction projects with the Commission and the City of Coronado when these designs become publically-available, and stated that federal acquisitions law prevents the Navy from providing this information prior to its publication in the Federal Register. The Navy also reiterated its intention to solicit and accept comments from neighboring communities on building design, and to work with the City of Coronado to achieve a visually-compatible aesthetic for the Coastal Campus.

Based on this information, the Commission finds that the proposed project is consistent with the visual resources policy of the CCMP (Coastal Act Section 30251).

G. PUBLIC ACCESS AND RECREATION

The Coastal Act provides for the protection and enhancement of coastal public access and recreation. Coastal Act Sections 30210, 30211 and 30212 state (in part):

Section 30210: In carrying out the requirement of Section 4 of Article X of the California Constitution, maximum access, which shall be conspicuously posted, and recreational opportunities shall be provided for all the people consistent with public safety needs and the need to protect public rights, rights of private property owners, and natural resource areas from overuse.

Section 30211: Development shall not interfere with the public's right of access to the sea where acquired through use or legislative authorization, including, but not limited to, the use of dry sand and rocky coastal beaches to the first line of terrestrial vegetation.

Section 30212(a): Public access from the nearest public roadway to the shoreline and along the coast shall be provided in new development projects except where: (1) it is inconsistent with public safety, military security needs, or the protection of fragile coastal resources, (2) adequate access exists nearby, or (3) agriculture would be adversely affected.

Coastal Act Section 30220 states:

Coastal areas suited for water-oriented recreational activities that cannot readily be provided at inland water areas shall be protected for such uses.

Coastal Act Section 30252 provides (in part):

The location and amount of new development should maintain and enhance public access to the coast by (1) facilitating the provision or extension of transit service, (2) providing commercial facilities within or adjoining residential development or in other areas that will minimize the use of coastal access roads, (3) providing nonautomobile circulation within the development, (4) providing adequate parking facilities or providing substitute means of serving the development with public transportation, (5) assuring the potential for public transit for high intensity uses such as high-rise office buildings, ...

The Coronado peninsula, on which SSTC-S, NAB Coronado and NASNI are situated, is a major recreational destination, in large part due to its coastal location, which provides water-oriented recreational opportunities and access to numerous beaches. San Diego Bay and the Pacific Ocean are used extensively by tourists and residents for boating, fishing, bathing and other recreational activities. The ocean shoreline between Coronado and Imperial Beach consists of almost 10 miles of sandy beach, including popular municipal beaches and Silver Strand State Beach, immediately to the north of SSTC-S. The 24-mile Bayshore Bikeway runs between Coronado and downtown San Diego along the shore of San Diego Bay; a segment of the Bikeway runs along the eastern boundary of SSTC-S. State Highway 75 (SR-75), a state-designated scenic highway, also runs along the bay and is the primary access road for the entire peninsula. The YMCA Surf Camp, a seasonal day- and overnight camp for youth, is operated on 45 acres of land leased from the Navy in the southwestern corner of SSTC-S (**Exhibits 3, 5a**).

Public access to the proposed project areas, including SSTC-S, NAB and NASNI, is restricted to military personnel, and would remain so during and after project implementation. The beach area west of SSTC-S is currently accessible from Silver Strand SB to the north and Imperial Beach municipal beaches to the south. The Navy periodically restricts beach and ocean access at SSTC-S during training exercises; increases in the frequency of training activities and temporary beach closures at SSTC-S were reviewed by the Commission under a prior consistency

determination (CD-033-10) and are not considered further here. In its consistency determination, the Navy states:

Implementation of the proposed action would not change public access to the sites and development of the Coastal Campus would have no effect on existing public access to the coast.

Development of new facilities within SSTC-S, NAB Coronado and NASNI would not alter the availability, access to, or functions of the recreational areas including operation of and access to YMCA Camp Surf.

Public access to all existing recreational facilities would be maintained and no changes to the recreational or adjoining land uses are proposed resulting in no effect to coastal recreation as a result of the proposed project.

In response to staff questions about existing access to the beach area west of the proposed SSTC-S campus, the Navy additionally states:

The public currently is allowed access to the beach are immediately west of SSTC-S below the mean high tide line. The Navy does not currently close the beach except during select training events. This proposal would not change beach access.

The Commission agrees with the Navy that the proposed project, which would occur almost entirely within the fenced perimeter of the Navy sites, would not directly encroach upon existing beach or shoreline access. However, as discussed below, the indirect effects of traffic congestion stemming from the proposed development have the potential to impede shoreline access in the area.

Traffic Impacts on Coastal Access

The proposed project would increase traffic congestion at multiple intersections along Silver Strand Blvd. (SR-75) during both construction and operation of the Coastal Campus facility. Because of the popularity of the Coronado peninsula as tourist destination, and the status of SR-75 as the only coastal access corridor for much of the peninsula, increased traffic congestion on this road has the potential to restrict public access to the coast.

The traffic analysis contained in the Draft EIS concluded that “significant and unmitigatable” traffic impacts would occur along SR-75 due to the construction of the Coastal Campus (DEIS, pp. 3.9-31 to 3.9-35). Congestion at 14 - 17 intersections along the SR-75 corridor in Coronado (6 - 7 intersections), Imperial Beach (4 - 8 intersections) and the Egger Highlands district of San Diego (3 intersections) would become severe – falling to “level of service” (LOS) E or F -- at some point during the ten-year construction period (2015-2023), depending on the scenario analyzed.¹⁹ Though the Navy refers to these impacts as “temporary”, at many intersections the

¹⁹ Under Transportation Research Board LOS criteria for intersections, LOS E is characterized as “operations where there is significant delay, extensive queuing, and poor progression”; LOS F is characterized as “operations that are unacceptable to most drivers, when the arrival rates exceed the capacity of the intersection”.

severe levels of traffic congestion would be sustained throughout all or most of the 2015 to 2023 period.

Operation of the new Coastal Campus and potential new facilities at NAB or NASNI would also introduce new traffic flows, generating an estimated 4000 to 4200 additional daily trips on SR-75 as compared to the present. Though the distribution of the new traffic flows depends in part on which project alternative is constructed, the proposed concentration of new facilities at SSTC-S ensures that virtually all the new trips will occur to and from this site, and that a portion of the current trips to and from the NAB in Coronado would shift southward to the new coastal campus. The traffic analysis contained in the Navy's Draft EIS examined current and projected LOS at 33 intersections along the SR-75 corridor, including scenarios with and without the proposed project alternatives, and with one to three aircraft carriers in port. Even without the proposed project, traffic congestion along SR-75 is expected to worsen over the coming decades, with numerous intersections declining to LOS E or F. Construction of the Coastal Campus would exacerbate this situation. The Draft EIS identifies five to eight key intersections in Coronado/Silver Strand (1 – 2 intersections), Imperial Beach (3 – 4 intersections) and San Diego (1 – 2 intersections), depending on the project alternative, number of carriers in port, and time frame (year 2024 or 2040), that would be significantly impacted with full implementation of the proposed project.

It is important to note that the Navy's traffic analysis is focused on peak morning and evening commute hours rather than weekends and holidays, when public access and recreation is most likely to be affected. However, as the Draft EIS notes:

Traffic patterns in Coronado are unique in that peak hours are spread over a longer time period because of the Navy's staggered work times and because of heavy tourism traffic that occurs outside of peak hours.

Because of the area's popularity as a tourist destination, the effects of increased traffic congestion on public access may also become a concern on weekdays, particularly during the summer months.

The Navy has proposed a set of mitigation and impact avoidance and minimization measures to address increased traffic congestion at intersections where these impacts were deemed significant. Measures to address significant impacts associated with the construction phase of the proposed project are as follows:

- construct the new northern entry point to SSTC-S as soon as possible;
- include construction management in the design aspect of the project;
- monitor daily activity levels during construction;
- scheduling heavy periods of vehicle activity during non-peak hours;
- encourage carpooling and staggered work hours for construction workers;
- notify public stakeholders of times where abnormal construction activity would occur.

In addition to these measures, the Navy has proposed mitigation measures for the projected significant traffic impacts at key intersections during the operations phase of the project:

- modification of traffic signal timing and phasing;
- modification of lane configurations/lane restriping;
- addition of left-turn lanes, shared through- and right-turn lanes;
- removal of crosswalk to allow changes to signal phasing;
- removal of parking spaces to allow lane addition/reconfiguration.

These measures would be implemented over time at the various affected intersections, and based on the Navy's analysis in the Draft EIS, would reduce traffic congestion to the levels of service projected under the "no project" scenarios for the years 2024 and 2040. The Navy states in the Draft EIS that the proposed measures would be implemented by the Navy, Caltrans, and/or the City of Imperial Beach. In further discussion with Commission staff, the Navy has stated that:

The proposed action would implement a bike and pedestrian pathway onto the [SSTC-S] site from SR-75 and the Bayshore Bikeway ... The Navy is also currently evaluating placement of a bus stop near or on the project site at the north entrance. In moving forward, the project design will also continue to evaluate this issue further and look for ways to reduce its traffic impact to the surrounding system.

Local Government Concerns

The Cities of Coronado and Imperial Beach have submitted comment letters expressing strong concern over projected increases in traffic congestion resulting from the proposed project. Recommendations contained in these letters include (but are not limited to) the following:

- Do not implement the "construction north, operations south" construction scenario (*see* DEIS, p. 3.9-32), which would increase the number of Imperial Beach intersections experiencing significant increases in construction traffic, including in residential neighborhoods.
- Close the SSTC-S southern gate to regular vehicle use to avoid traffic impacts in residential neighborhoods of Imperial Beach and at the Silver Strand Blvd./Palm Ave. intersection.
- Fund and implement all traffic impact avoidance, minimization and mitigation measures prior to and/or in concert with construction activities.
- Coordinate with the cities of Coronado, Imperial Beach, and San Diego during the design and implementation of all traffic improvements.
- Partially or fully fund the costs of street and traffic signal improvements needed to avoid/minimize/mitigate traffic impacts.
- Work with Caltrans, Cities of Imperial Beach and San Diego on comprehensive traffic signal improvements along SR-75 corridor between Imperial Beach and I-5.
- Develop and implement a Transportation Demand Management Plan that would encourage and support the use of alternate modes of transportation; such plan could

include a carpool/vanpool program; bicycle and pedestrian friendly campus design; inter-installation shuttle service; construction of bus stops and extension of municipal transit service to serve the northern site entrance; reinstatement of bay ferry service; charging of on-site parking fees; include carpool lanes at site entrance; etc.

To date, the Navy has not released its responses to comments received on the Draft EIS, so it is unclear to what degree these recommendations will be considered.

However, at the hearing, the Navy committed to avoiding construction activities that would generate significant traffic flows during weekends and holidays, to allowing temporary construction access to SSTC-S from the existing northern access road, and to completing the construction of the new northern entrance road and gate by the beginning of 2018. The Navy also described its existing Transportation Incentives Program, which affords every military and federal civilian employee at NAB the opportunity to participate in subsidized vanpool, rideshare, or public transit voucher programs.

The Navy's proposed mitigation, avoidance and minimization measures are likely to reduce the increase in traffic congestion in the SR-75 corridor stemming from the proposed project, and the commitment to avoid construction traffic during weekends and holidays would protect recreational access to the coast during these peak visitation periods. For these reasons, the Commission finds that the proposed project is ~~not~~ consistent with the public access and recreation policies of the CCMP (Coastal Act Sections 30210, 30211, 30212, 30220 and 30252).

H. ENERGY CONSUMPTION AND VEHICLE MILES TRAVELED

In an effort to decrease the consumption of natural resources and reduce emissions of air pollutants, including greenhouse gases (GHG), the Coastal Act includes policies requiring that new development minimize energy consumption and vehicle miles traveled throughout the life of the project. Section 30253(d) of the Coastal Act provides:

New development shall ... (d) Minimize energy consumption and vehicle miles traveled.

Energy Consumption

The Navy's consistency determination does not address the minimization of energy consumption associated with the construction and operation of the proposed Coastal Campus project. The Draft EIS addresses the issue indirectly when discussing the cumulative impacts of GHG emissions resulting from the project. The Navy concludes that annual GHG emissions from the proposed project "would not contribute substantially to cumulative impacts associated with global climate change" (DEIS, p. 4-10), and goes on to present a broad outline of Navy programs to reduce energy consumption and shift to renewable and alternative fuels:

The Secretary of the Navy established several goals for reducing the Navy's consumption of fossil fuels:

- *Mandate that energy usage, efficiency, life-cycle costs, and other such factors be part of the Navy's decision when acquiring new equipment or systems, as well as vendor efficiency or energy policies;*
- *Cut petroleum use by half in the Navy's fleet of commercial vehicles by 2015 by phasing in new hybrid trucks to replace older ones;*
- *Procure half the power at Navy shore installations from alternative energy sources, including wind or solar, by 2020 and, where possible, supply energy back to the grid, as the Navy does today at Naval Air Weapons Station China Lake, California; and*
- *Reach the point that half the energy used throughout the Navy, including in ships, aircraft, vehicles, and shore stations, comes from alternative fuel or alternative sources by 2020. Today that percentage is about 17 percent.*

These examples illustrate the leadership role that the Navy has in achieving energy reductions, which will contribute to the national effort to mitigate global climate change.

The DEIS describes measures to minimize energy consumption and GHG emissions at the SSTC-S Coastal Campus as follows:

The Proposed Action's buildings and facilities would be designed following established principles of sustainability, thereby meeting the standards set forth in EO 13423, EO 13514, and the EISA, as well as applicable Navy guidelines and regulations. The NBC Coastal Campus would include the design of an integrated layout, along with thermal and photovoltaic solar systems (on the rooftop of the proposed buildings and carports).²⁰

In subsequent discussions with Commission staff, the Navy has further stated:

The Coastal Campus proposal would provide facilities at Naval Base Coronado for Naval Special Warfare Command that would use less energy and water and would be certified to LEED Silver. Projects included in the alternatives would be constructed in compliance with applicable sustainability and energy-efficiency guidelines and regulations (e.g., EO 13423, Strengthening Federal Environmental, Energy, Energy, and Transportation Management; EO 13514, Federal Leadership in Environmental, Energy, and Economic Performance; and the Energy Independence and Security Act of 2007 [EISA]). EO 13423 requires that Federal agencies improve energy efficiency, reduce greenhouse gas (GHG) emissions, and implement sustainable building practices (Department of Energy 2007a). It also requires Federal agencies to Comply with the Guiding Principles for New Construction and Major Renovation. EO 13514 requires that Federal agencies comply with the Guiding Principles for New Construction and Major Renovation. It also requires that at least 15 percent of each agency's facilities and building leases (more than 5,000 gross square feet) meet the

²⁰ Executive Order 13423, "Strengthening Federal Environmental, Energy, and Transportation Management, George W. Bush, January 26, 2007; Executive Order 13514, Federal Leadership in Environmental, Energy and Economic Performance, Barack Obama, October 5, 2009; Energy Independence and Security Act of 2007 (EISA).

Guiding Principles by 2015 for existing buildings. The Energy Independence and Security Act of 2007 (EISA) is an Act of Congress concerning the energy policy of the U.S. One of the stated purposes of the EISA is to increase the efficiency of buildings and to improve the energy performance of the Federal government (Department of Energy 2007b).

The Navy has since clarified to Commission staff that new Coastal Campus facilities would be designed to achieve energy and water efficiency equivalent to a LEED Silver rating, though the Navy may not pursue formal certification. At the hearing, the Navy also stated that it is committed to building the Coastal Campus as a “zero net energy consumer.” The Commission supports the Navy’s organizational goals for reducing fossil fuel consumption, and its commitment to implementing the proposed project in conformance with federal law. At this phase in the Navy’s planning process, individual building designs are not yet available, and the exact mix of energy efficiency measures to be implemented will likely vary from project to project. Such measures may include the use of green roofs, window shading, low emissivity glass for windows, solid rain canopies, day-lighting of work spaces, light-colored building exteriors, PV solar panels, high efficiency lighting, solar tubes, natural ventilation, high quality insulation, and green and recycled building materials. The Commission therefore concludes that a framework is in place to assure that the proposed project will minimize energy consumption in the new buildings and facilities.

Vehicle Miles Traveled

As discussed in Subsection G above, the Navy estimates that the proposed project, including full operation of the proposed Coastal Campus, would generate over 4000 additional daily trips on SR-75, representing a substantial increase in vehicle miles traveled and associated energy consumption and emissions in comparison to the present. The Navy’s traffic study (KHA 2014; Appendix D-2 to the DEIS) further estimates that 90% of the users of the SSTC-S campus will commute in a private vehicle. The Navy’s proposed traffic minimization and mitigation measures (summarized in the previous section) are focused almost exclusively on road and signal improvements, largely ignoring measures that would improve traffic flow by reducing the number of vehicles on the road and vehicle miles traveled. The Navy has stated that the proposed project would include a bike and pedestrian pathway onto the SSTC-S site from SR-75 and the existing Bayshore Bikeway (see Subsection G, above), and that it would “evaluate” the placement of a new bus stop near the site entrance, but has not committed to implementing any other measures that would reduce reliance on single-occupancy for accessing the Coastal Campus and potential new facilities at NAB and NASNI. At the hearing, the Navy described its existing Transportation Incentives Program, which provides subsidized opportunities for its employees to participate in vanpool rideshare, and transit voucher programs, and pledged to work closely with the City of Coronado to explore additional ways of alleviating traffic congestion.

Conclusion

Accordingly, the Commission concludes that the proposed project is consistent with the energy and vehicle miles traveled policy of the CCMP (Coastal Act Section 30253(d)).

I. WATER QUALITY

Coastal Act Section 30231 states:

The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of groundwater supplies and substantial interference with surface water flow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.

The proposed Coastal Campus development would occur entirely on land, with no in-water construction or new training activities that have not previously been reviewed by the Commission (e.g., CD-033-10). However, the construction and operation of the proposed Coastal Campus could adversely affect coastal waters, wetlands or vernal pools on or adjacent to SSTC-S. There are approximately 21 acres of wetlands and 11 acres of vernal pools on the SSTC-S. If not controlled, pollutants and runoff from the proposed development can be expected to reach these low-lying areas and nearby coastal waters. Conversion of the existing, largely undeveloped landscape to a developed landscape dominated by impervious surfaces could change the timing, volume, spatial pattern and quality of runoff, and thus degrade the quality of downstream receiving waters. In its consistency determination, the Navy summarizes the project's potential effects on water quality as follows:

The proposed action would increase impervious surfaces and associated stormwater runoff, including on-site and off-site drainage patterns compared to existing conditions. The impervious surfaces are roof areas, parking facilities, roads, and walkways. Increased vehicle traffic has the potential for additional pollutants in the runoff.

The Navy's Draft EIS provides a more detailed picture of the project's potential water quality impacts, highlighting the following:

- Increased impervious surfaces and associated runoff;
- Increased vehicular traffic, increased potential for pollutants from vehicle use (e.g., copper, zinc, motor oil, PAHs, etc.) in runoff;
- Altered on-site and off-site drainage patterns, including undesirable increases in runoff flow rates or volumes;
- Mobilization of sediment during storm events due to excavation and other ground-disturbing construction;
- Spills and discharges of contaminants from heavy construction equipment.

The Navy has committed to addressing these potential adverse impacts by implementing a variety of water quality measures, summarized as follows in its consistency determination:

Implementation of avoidance and minimization measures would reduce or eliminate the amount of pollutants entering water resources and the volume and direction of runoff from the site. Although the Coastal Campus project has a goal of zero storm water discharge, should that not be achieved, runoff during construction and post construction operations would be minimized and treated through Low Impact Development (LID), site design, and/or structural Best Management Practices (BMPs). Drainage design would maintain existing runoff patterns to the maximum extent practicable, and retain all runoff on-site (zero discharge) for treatment. Runoff would be directed to different types of LID storm water treatment and storage facilities to remove various pollutants from the runoff and to store storm water for on-site infiltration and evaporation. These design features would reduce runoff volume, capture runoff pollutants on-site, provide groundwater recharge, and offer a supplemental resource for irrigation and/or graywater use in facilities.

The project would adhere to the NBC National Pollutant Discharge Elimination System (NPDES) Permit and Construction General Permit requirements. As such, erosion and sediment controls would be used and a project specific Storm Water Pollution Prevention Plan (SWPPP) would be in place during construction activities to reduce the amount of soils disturbed and to prevent disturbed soils from entering runoff to surface/receiving waters.

Based on the above analysis, all water quality impacts would be temporary and localized, therefore, there would be no effect to water quality.

A detailed list of the various water quality protection measures the Navy has proposed is provided as **Exhibit 16**. The measures include (but are not limited to): Use of soft-bottom and vegetated detention basins and drainage features, with the goal of maximizing infiltration; use of pervious materials for necessary hardscapes; and implementation erosion, runoff, and sediment control BMPs during construction. As noted in the Draft EIS (p. 3.5-14), the proposed project must adhere to the requirements of both the NBC National Pollutant Discharge Elimination System (NPDES) Permit and a new NPDES Construction General Permit to be issued by the San Diego RWQCB. Any additional measures required under these permits can be expected to strengthen the water quality protections proposed in the DEIS.

The Commission staff has, in its discussions with the Navy, expressed concern that the proposed handling of storm water, in particular the project goal of “zero storm water discharge” (see above), has the potential to alter or disrupt the existing hydrologic regimes of the various wetlands and vernal pools occurring in the southern areas of SSTC-S.²¹ While recognizing the need to avoid large increases in surface runoff to these aquatic habitats due to the emplacement of impervious surfaces within the development footprint, the Commission staff was concerned that too high a degree of storm capture could have unintended consequences, such as depriving the pools and wetlands of a necessary water source, or altering the seasonal cycles during which these habitats are wet or dry. In its response, the Navy’s clarified that the vernal pool and wetland areas at SSTC-S do not presently receive runoff from the proposed project footprint,

²¹ September 17, 2014, correspondence between U.S. Navy and Commission staff.

except under rare circumstances, and that the project will not substantially alter their hydrologic regimes:

The existing drainage on the northern portion of SSTC-South does not reach the vernal pools in the southern portion of the site, except under very rare storm events (i.e., 100-year storm). In that instance, drainage from the north may reach the area, but only for a very short period of time, and that runoff would not be substantial enough to permanently alter the vernal pool structure. Groundwater, rainwater, subsurface runoff, and surface runoff within the southern region itself presumably support the vernal pools.

The intent of the drainage design for the proposed Coastal Campus is to keep the existing runoff patterns to the maximum extent practicable, retain all of the runoff on site and provide infiltration opportunities for all of the runoff that falls on impervious areas.

...

The mitigation of all the impervious area by providing infiltration or water-reuse opportunities will also protect the existing biological sensitive areas by not directing more runoff to these areas than there is today.

Based on this information, the Commission agrees with the Navy that the proposed handling of storm water from the development footprint will not substantially alter the hydrologic regimes of existing wetlands and vernal pools at SSTC-S.

In conclusion, the Commission agrees that the storm water runoff and water quality measures presented in **Exhibit 16** will protect the biological productivity and quality of coastal waters, wetlands, and vernal pools at SSTC-S, and will minimize waste water discharges, control runoff, prevent depletion of groundwater supplies, and avoid substantial interference with surface water flow. The Commission thus finds that the proposed project is consistent with the water quality policy of the CCMP (Coastal Act Section 30231).

J. CULTURAL RESOURCES

Coastal Act Section 30244 states:

Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.

The proposed project has the potential to adversely affect a number of cultural resources within the SSTC-S development footprint, including ten archaeological sites, the former landscape of the late-19th century Coronado Heights development, including the remnant street pattern, scattered cypress tree plantings along the streets, a segment of the former San Diego and Coronado Railroad, several batteries, bunkers and other structures included in the Fort Emory Coastal Battery Historic District, and the Wullenweber Antenna Array.

No cultural resources would occur within the area of potential effects for possible projects at NAB and NASNI under Alternative 3.

Archaeological Resources

The archaeological resources within the SSTC-S development footprint consist of lithic and shell scatter and midden sites associated with Native American and pre-historic use of the Silver Strand for resource procurement. In all but one case, the Navy is recommending these sites as “not eligible” for listing on the National Registry of Historic Places (NRHP), and is seeking State Historic Preservation Officer (SHPO) concurrence with these evaluations as part of a pending Section 106 consultation under the National Historic Preservation Act (NHPA). The one recommended NHRP-eligible site has the potential to be affected by proposed electrical system upgrades. However, in its consistency determination the Navy states that “the upgrade would not require additional ground disturbance thus the cultural resources manager determined a no adverse effect to the historic property.” With regard to the other sites not being recommended as eligible, the Navy concludes that these “are not historic properties and cannot be affected under Section 106” (DEIS, p.3.8-13).

The SSTC-S development footprint has been surveyed for cultural resources on several previous occasions, but areas outside the formal footprint, including areas slated for off-site traffic improvements, the right-of-way of the proposed northern access way, and utility improvements, have not been surveyed. The Navy proposes to address unknown or undiscovered cultural resources within these areas as follows:

Potential effects to cultural resources from proposed ground disturbing off-site traffic, access and utility improvements would be addressed through coordination with State Parks and Caltrans for cultural resource surveys, development of a monitoring and discovery plan, and required cultural resource monitoring during excavation activities. Any accidental discovery of human remains during excavation would be addressed under the Native American Graves and Repatriation Act for remains found on federal lands, and through consultation with the Native American Heritage Commission for remains found on nonmilitary Federal lands and non-Federal lands.

Historic Structures

A 1997 historic resources evaluation of World War II-era structures at SSTC recommended that the Wullenweber Antenna Array and six other structures contributed to the Fort Emory Coastal Battery Historic District and were NRHP eligible (Herbert and Byrd 1997). These historic structures include two batteries, including the Building 99 bunker proposed for removal, concrete slabs and piers formerly supporting big guns, a plotting and sighting room, and two fuel tank pits. Neither the historic street grid nor the railroad remnants discussed above were recommended as NRHP eligible. Among these recommendations, only those involving the street grid, railroad remnants, and antenna array are subject to SHPO review. The Fort Emory structures are covered by the 2003 San Diego Metro Area Programmatic Agreement, and require only a finding by CNRSW, without outside Section 106 consultation, to be determined eligible. The Wullenweber Antenna Array was found eligible for the NRHP in 1999, and Section 106 consultation with the SHPO was completed in 2010 pertaining to the Navy’s proposal to

demolish the antenna. Under a 2010 MOA with the SHPO, the Navy is required to preserve the antenna array control building (Building 1) and a segment of the array, but may dismantle the remainder. The Navy is currently seeking SHPO concurrence on the non-eligibility recommendation for the street grid and railroad remnants as part of the Section 106 consultation for the Coastal Campus project.

Under the proposed project, the historic Fort Emory structures would be preserved, with the possible exception of the Building 99 battery, which would be demolished under the preferred alternative. In its consistency determination, the Navy states:

Potential demolition of Bldg 99, a contributor to the Fort Emory Coastal Defense Historic District, would constitute an adverse effect to this historic property. As such, resolution of the adverse effect would be defined with pending completion of Section 106 consultation with the State Historic Preservation Office and Advisory Council on Historic Preservation as required by Federal law. Any action pertaining to Bldg 99 would be taken in accordance with a Memorandum of Agreement for resolving the adverse effect. Such Memorandum of Agreement would be completed in advance of the demolition.

Conclusion

The Navy has initiated a Section 106 consultation with the SHPO, which is estimated to be completed by February of 2015. As part of this consultation, the SHPO will review the Navy's NRHP eligibility and adverse effect determinations for cultural resources at the proposed project site. Where necessary, the SHPO will require reasonable measures to mitigate for any adverse effects to cultural resources. With this review process in place, the Commission finds that the proposed project is consistent with the cultural resources policy of the CCMP (Coastal Act Section 30244).

Re: **CD-0003-014**, U.S. Navy, Construction of 1.5 million square foot Coastal
Campus at Silver Strand Training Complex – South, Naval Base Coronado, San
Diego County

Dear Captain Sund:

On November 12, 2014, by a vote of seven in favor, four opposed, the California Coastal Commission concurred with the above-referenced consistency determination for a 1.5 million square foot campus development at Silver Strand Training Complex – South, within Naval Base Coronado. The Commission found the project to be consistent to the maximum extent practicable with the California Coastal Management Program. The Commission staff will prepare “Revised Findings” for Commission adoption at a future meeting to fully explain the basis for its decision.

Sincerely,

A handwritten signature in blue ink that reads "Joseph Street".

RE: Memorandum of Agreement, Demolition of Building 99, Silver Strand Training Complex South,
Naval Base Coronado, CA

Dear Mr. Bethke:

Accompanying this letter is a signed copy of the *Memorandum of Agreement between the Department of the Navy and the California State Historic Preservation Officer regarding the Demolition of Building 99 (Battery 134 Getchell), Naval Base Coronado, California* (MOA). As both consulting parties have signed the MOA, please consider consultation complete. The Agreement will be considered executed once the Navy has filed a copy with the Advisory Council on Historic Preservation.

Sincerely,

A handwritten signature in black ink that reads "Carol Roland-Nawi, Ph.D.".

Carol Roland-Nawi, Ph.D.
State Historic Preservation Officer

MEMORANDUM OF AGREEMENT
BETWEEN
THE DEPARTMENT OF THE NAVY AND
THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER
REGARDING THE DEMOLITION OF BUILDING 99 (BATTERY 134 GETCHELL),
NAVAL BASE CORONADO, CALIFORNIA

WHEREAS, the Department of the Navy (Navy) proposes to construct the Coastal Campus complex at the Silver Strand Training Complex-South (SSTC-S), a component of Naval Base Coronado (NBC), which includes the demolition of the historic property Building 99; and,

WHEREAS, this proposal constitutes an Undertaking subject to consultation performed under the authority of Section 106 of the National Historic Preservation Act (NHPA), 16 U.S.C. § 470f, and it's implementing regulations, 36 CFR Part 800; and,

WHEREAS, the Undertaking is located within the Fort Emory Coastal Battery Historic District; the historic district was recommended as National Register of Historic Places (NRHP)-eligible in 1997 as "resources related to coastal defense plans developed during World War II to protect the strategically important harbor at San Diego and the defense industries located within the city" under Criteria A and C with a period of significance from 1942-1945; this 1997 study found 6 contributing and 5 non-contributing elements of the Historic District; importantly, the Fort Emory Coastal Defense Historic District is the "linear descendants of Spanish, Mexican, and American batteries placed on Point Loma to protect the city and harbor in earlier times" and are non-contiguous elements of the San Diego coastal defense network during World War II that includes Point Loma's Battery Ashburn; and,

WHEREAS, the Navy finds the Undertaking will adversely affect Building 99, also known as Battery 134 Getchell, which has been identified as a contributing resource within the larger Fort Emory Coastal Battery Historic District; and,

WHEREAS, the demolition of Building 99 constitutes an Adverse Effect to the Fort Emory Coastal Defense Battery, the extent of which will be studied in Stipulation A; and,

WHEREAS, the Navy has consulted with the California State Historic Preservation Officer (SHPO) and other interested parties regarding the Undertaking pursuant to Stipulation VIII (D) of the 2014 Naval Base Coronado Programmatic Agreement (PA), and has notified the Advisory Council on Historic Preservation (Council) of the determination of Adverse Effect to the Historic District in accordance with 36 CFR § 800.6(a) (1) who has chosen not to participate in the consultation; and,

WHEREAS, the Navy will execute this Memorandum of Agreement (MOA) to evidence satisfactory compliance with Section 106 of the NHPA;

NOW THEREFORE, the Navy and the SHPO agree that the Navy will implement the Undertaking in accordance with the following stipulations in order to take into account the effect

of the Undertaking on historic properties, and that these stipulations will govern the Undertaking until this Section 106 MOA is terminated.

STIPULATIONS

The Navy will ensure that the following measures are carried out:

A. RECORDATION

The Fort Emory Coastal Defense Battery, including all six contributing resources, will be recorded in accordance with the standards of the Historic American Buildings Survey, as modified below. The Navy will ensure that the historic property is not adversely affected until the documentation stipulated hereunder has been completed.

- 1) Documentation Standards. The goal of the documentation will be to preserve information on the historical and technological significance, and character of the facility for scholars, architects, engineers, and interested members of the public. It will consist of drawings, site and historical photographs, and written data conveying and interpreting the facility's characteristics and significance.
 - a) Drawings. Selected existing architectural and/or engineering drawings, site plans, and maps illustrating important aspects of the facility's design and development will be reproduced photographically and/or xerographically. Reproductions will be on archival-stable media.
 - b) Photography. Photographic documentation will provide views of important exterior, interior, contextual, engineering details, and photographic reproductions of historic photographs. Photographs will be prepared in a high-resolution digital format. View selection, and content will record in adequate detail important characteristics of the property. Photographs will be provided in standard digital formats (tiff and jpg) and archival-stable photographic prints.
 - c) Oral History. Oral histories should be gathered from living service members and builders with experience at this or other similar Coastal Defense sites in California and from other experts in the field of Coastal Defense systems. Other existing oral histories shall also be collected from relevant repositories, including but not limited to the National Archives, the Library of Congress, the Naval History and Heritage Command, the Coronado Historical Society, the San Diego History Center, and the Coastal Defense Study Group.
 - d) Written Data. A narrative history and physical description will document and interpret the character and significance of the historic district.

2) NRHP Historic District Re-Evaluation

- a) It remains unclear what effect the demolition of Building 99 will have on the district as a whole, meaning, whether the Fort Emory Historic District will retain enough integrity to remain eligible for the NRHP. Once demolition has concluded, the Navy will re-evaluate the Fort Emory Historic District to render a NRHP determination of eligibility in subsequent consultation with SHPO per 36 CFR 800.4.
- 3) SHPO Review. The Navy will provide the SHPO with a draft documentation package for comment. Taking into account comments from the SHPO, the Navy will prepare and distribute the final documentation package.
 - a) Proposed Documentation Plan. The Navy will provide the SHPO an opportunity to comment on a technically detailed proposal for the recordation. The SHPO will provide comments on the proposed documentation plan within 30 days of receiving the proposal. The Navy will review and respond to all comments to the draft documentation plan within 30 days from receipt of the comments.
 - b) Distribution of Final Documentation. The Navy will provide copies of the documentation to the SHPO, the San Diego Historical Society, the California Room of the San Diego Public Library, the University of San Diego's Copley Library, the Imperial Beach branch of the San Diego County Library, the Coastal Battery Study Group, and the Navy will retain a copy within Commander Navy Region Southwest (CNRSW) oversight.
 - c) NRHP Re-evaluation. Upon completion of the NRHP-re-evaluation, the Navy will consult with SHPO per 36 CFR 800.4 to identify the remaining historic properties.

B. SALVAGE

- 1) World War II equipment and equipment may yet remain in the Battery, specifically the gun #2 de-contamination room. The Navy may loan such historical material to the Coastal Defense Study Group (CDSG) and one of the regional museums who preserve similar series 100 Batteries. The Navy will work with CDSG to identify historical material and locate an appropriate recipient to preserve this history.

C. DISCOVERIES AND UNANTICIPATED EFFECTS

- 1) The Navy will ensure that any post-review discoveries or unanticipated effects identified during the course of the Undertaking are addressed in accordance with 36 CFR §§ 800.13(b) (3) and 800.13(c) and Stipulation X of the 2014 *Programmatic Agreement Among the Commander Naval Base Coronado and the California State Historic Preservation Officer*.

D. RESOLVING OBJECTIONS

- 1) Should the SHPO or the Navy object in writing to the manner in which the terms of this MOA are implemented, to any action carried out or proposed with respect to implementation of the MOA, or to any document prepared in accordance with and subject to the terms of the MOA, the Navy will immediately proceed to consult with the SHPO for no more than 30 days to resolve the objection. If on-site work has already begun, it will not be stopped during this consultation period without the concurrence of the Commanding Officer, Naval Base Coronado.
- 2) If the objection is resolved during the above 30-day consultation period, the Navy may proceed with the previously disputed action in accordance with the terms of such resolution.
- 3) If, after initiating such consultation with the Navy, and the objection cannot be resolved through consultation, the Navy will forward all documentation relevant to the objection, including the Navy's proposed response to the objection to the Council. The Council will transmit its comments to NBC within forty-five (45) days after receipt of such documentation in accordance with 36 CFR § 800.7(c).
- 4) The Navy will take into account any Council recommendation or comments and any comments from the SHPO in reaching a final decision regarding the objection. The Navy's responsibility to carry out all actions under this MOA that are not the subject of the objection will remain unchanged.
- 5) The Navy will provide the SHPO and the Council (if the Council has commented) with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.
- 6) The Navy may authorize any action subject to objection under this stipulation to proceed and allow for concurrent or delayed resolution in accordance with the terms of this stipulation.

E. AMENDMENTS

- 1) The Navy or the SHPO may at any time propose amendment of this MOA whereupon the Navy and the SHPO will consult to consider such amendment pursuant to 36 CFR §§ 800.6(c) (7) and 800.6(c) (8). This MOA may be amended only upon written concurrence of both the Navy and the SHPO.

F. TERMINATION

- 1) The Navy or the SHPO may terminate this MOA. If this MOA is not amended as provided for in Stipulation D, or if either the Navy or the SHPO proposes termination of this MOA for other reasons, the signatory proposing termination will in writing

notify the other signatory, explain the reasons for proposing termination, and consult with the other signatory for at least 30 days to seek alternatives to termination. Should such consultation result in an agreement on an alternative to termination, the signatories will proceed in accordance with the terms of that agreement.

- 2) Should such consultation fail, the signatory proposing termination may terminate this MOA by promptly notifying the other signatory in writing. Termination hereunder will render this MOA without further force or effect.
- 3) If this MOA is terminated hereunder, and if the Navy determines that its Undertaking will nonetheless proceed, then the Navy will consult in accordance with 36 CFR § 800.6 to develop a new MOA or request the comments of the Council pursuant to 36 CFR § 800.

G. DURATION OF THE MOA

- 1) Unless terminated earlier in accordance with Stipulation F, this MOA will remain in effect for five years following the last signature date by the Signatory Parties (Navy and SHPO). Following this five-year period, the agreement will terminate at that date certain. The Navy, in consultation with SHPO, will develop and provide a determination that the terms of the MOA have been fulfilled in a satisfactory manner. This determination will be provided in writing and the Navy will formally state that the terms of the agreement have terminated and have no further force and effect on the Navy.

H. EFFECTIVE DATE

- 1) This MOA will take effect upon the final signature date by the Navy and the SHPO.

I. EXECUTION

- 1) Pursuant to 36 CFR § 800.6(c), this MOA is an agreement with the Council for purposes of Section 106 of the NHPA. Compliance with this requirement is fulfilled by execution of this MOA by the Navy and the SHPO, transmittal by the Navy to the Council in accordance with 36 CFR § 800.6(b) (1) (iv), and subsequent implementation of its terms. Therefore, the Navy has afforded the Council an opportunity to comment on the Undertaking and its effect on historic properties. In addition, the Navy has taken into account the effect of the Undertaking on historic properties, and, upon completion of stipulated actions within the MOA, the Navy will have satisfied its responsibilities under Section 106 of the NHPA and 36 CFR Part 800.
